# Unidrive M200/M201

Variable Speed AC drive for induction motors

Part Number: 0478-0351-01

Issue: 1

#### **Original Instructions**

For the purposes of compliance with the EU Machinery Directive 2006/42/EC:

#### **General information**

The manufacturer accepts no liability for any consequences resulting from inappropriate, negligent or incorrect installation or adjustment of the optional operating parameters of the equipment or from mismatching the variable speed drive with the motor.

The contents of this guide are believed to be correct at the time of printing. In the interests of a commitment to a policy of continuous development and improvement, the manufacturer reserves the right to change the specification of the product or its performance, or the contents of the guide, without notice.

All rights reserved. No part of this guide may be reproduced or transmitted in any form or by any means, electrical or mechanical including photocopying, recording or by an information storage or retrieval system, without permission in writing from the publisher.

#### **Drive firmware version**

This product is supplied with the latest firmware version. If this drive is to be connected to an existing system or machine, all drive firmware versions should be verified to confirm the same functionality as drives of the same model already present. This may also apply to drives returned from an Emerson Industrial Automation Service Centre or Repair Centre. If there is any doubt please contact the supplier of the product.

The firmware version of the drive can be checked by looking at Pr 11.029 and Pr 11.035.

#### **Environmental statement**

Emerson Industrial Automation is committed to minimising the environmental impacts of its manufacturing operations and of its products throughout their life cycle. To this end, we operate an Environmental Management System (EMS) which is certified to the International Standard ISO 14001. Further information on the EMS, our Environmental Policy and other relevant information is available on request, or can be found at

http://www.emersonindustrial.com/en-EN/controltechniques/aboutus/environment/Pages/environment.aspx

The electronic variable-speed drives manufactured by Emerson Industrial Automation have the potential to save energy and (through increased machine/process efficiency) reduce raw material consumption and scrap throughout their long working lifetime. In typical applications, these positive environmental effects far outweigh the negative impacts of product manufacture and end-of-life disposal.

Nevertheless, when the products eventually reach the end of their useful life, they must not be discarded but should instead be recycled by a specialist recycler of electronic equipment. Recyclers will find the products easy to dismantle into their major component parts for efficient recycling. Many parts snap together and can be separated without the use of tools, while other parts are secured with conventional fasteners. Virtually all parts of the product are suitable for recycling.

Product packaging is of good quality and can be re-used. Large products are packed in wooden crates, while smaller products come in strong cardboard cartons which themselves have a high recycled fibre content. If not re-used, these containers can be recycled. Polythene, used on the protective film and bags for wrapping product, can be recycled in the same way. Emerson Industrial Automations' packaging strategy prefers easily-recyclable materials of low environmental impact, and regular reviews identify opportunities for improvement.

When preparing to recycle or dispose of any product or packaging, please observe local legislation and best practice.

#### **REACH legislation**

EC Regulation 1907/2006 on the Registration, Evaluation, Authorisation and restriction of Chemicals (REACH) requires the supplier of an article to inform the recipient if it contains more than a specified proportion of any substance which is considered by the European Chemicals Agency (ECHA) to be a Substance of Very High Concern (SVHC) and is therefore listed by them as a candidate for compulsory authorisation.

For current information on how this requirement applies in relation to specific Emerson Industrial Automations' products, please approach your usual contact in the first instance. Emerson Industrial Automations' position statement can be viewed at:

www.emersonindustrial.com/en-EN/controltechniques/aboutus/environment/reachregulation/Pages/reachregulation.aspx

### How to use this guide

This guide is intended to be used in conjunction with the appropriate Power Installation Guide. The Power Installation Guide gives information necessary to physically install the drive. This guide gives information on drive configuration, operation and optimization.

#### NOTE

There are specific safety warnings throughout this guide, located in the relevant sections. In addition, Chapter 1 *Safety information* contains general safety information. It is essential that the warnings are observed and the information considered when working with or designing a system using the drive.

This map of the user guide helps to find the right sections for the task you wish to complete, but for specific information, refer to Contents on page 4:

This declaration is issued under the sole responsibility of the manufacturer. The object of the declaration is in conformity with the relevant Union harmonization legislation. The declaration applies to the variable speed drive products shown below:

Model number	Interpretation	Nomenclature aaaa - bbc ddddde
aaaa	Basic series	M100, M101, M200, M201, M300, M400, M600, M700, M701, M702, F300, H300, E200,E300, HS30, HS70, HS71, HS72, M000, RECT
bb	Frame size	01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11
С	Voltage rating	1 = 100 V, 2 = 200 V, 4 = 400 V, 5 = 575 V, 6 = 690 V
ddddd	Current rating	Example 01000 = 100 A
е	Drive format	A = 6P Rectifier + Inverter (internal choke), D = Inverter, E = 6P Rectifier + Inverter (external choke), T = 12P Rectifier + Inverter (external choke)

The model number may be followed by additional characters that do not affect the ratings.

The variable speed drive products listed above have been designed and manufactured in accordance with the following European harmonized standards:

EN 61800-5-1:2007	Adjustable speed electrical power drive systems - Part 5-1: Safety requirements - Electrical, thermal and energy
EN 61800-3: 2004+A1:2012	Adjustable speed electrical power drive systems - Part 3: EMC requirements and specific test methods
EN 61000-6-2:2005	Electromagnetic compatibility (EMC) - Part 6-2: Generic standards - Immunity for industrial environments
EN 61000-6-4: 2007+ A1:2011	Electromagnetic compatibility (EMC) - Part 6-4: Generic standards - Emission standard for industrial environments
EN 61000-3-2:2014	Electromagnetic compatibility (EMC) - Part 3-2: Limits for harmonic current emissions (equipment input current ≤16 A per phase)
EN 61000-3-3:2013	Electromagnetic compatibility (EMC) - Part 3-3: Limitation of voltage changes, voltage fluctuations and flicker in public, low voltage supply systems, for equipment with rated current ≤16 A per phase and not subject to conditional connection

EN 61000-3-2:2014 Applicable where input current < 16 A. No limits apply for professional equipment where input power ≥1 kW.

These products comply with the Restriction of Hazardous Substances Directive (2011/65/EU), the Low Voltage Directive (2014/35/EU) and the Electromagnetic Compatibility Directive (2014/30/EU).

G Williams

Vice President, Technology Date: 17th March 2016

zign willen

These electronic drive products are intended to be used with appropriate motors, controllers, electrical protection components and other equipment to form complete end products or systems. Compliance with safety and EMC regulations depends upon installing and configuring drives correctly, including using the specified input filters.

The drives must be installed only by professional installers who are familiar with requirements for safety and EMC. Refer to the Product Documentation. An EMC data sheet is available giving detailed information. The assembler is responsible for ensuring that the end product or system complies with all the relevant laws in the country where it is to be used.

### 1 Safety information

### 1.1 Warnings, Cautions and Notes

A Warning contains information which is essential for avoiding a safety hazard.

A Caution contains information which is necessary for avoiding a risk of damage to the product or other equipment.

#### NOTE

A Note contains information which helps to ensure correct operation of the product.

### 1.2 Electrical safety - general warning

The voltages used in the drive can cause severe electrical shock and/or burns, and could be lethal. Extreme care is necessary at all times when working with or adjacent to the drive.

Specific warnings are given at the relevant places in this *Control User Guide*.

# 1.3 System design and safety of personnel

The drive is intended as a component for professional incorporation into complete equipment or a system. If installed incorrectly, the drive may present a safety hazard.

The drive uses high voltages and currents, carries a high level of stored electrical energy, and is used to control equipment which can cause injury.

Close attention is required to the electrical installation and the system design to avoid hazards either in normal operation or in the event of equipment malfunction. System design, installation, commissioning/start-up and maintenance must be carried out by personnel who have the necessary training and experience. They must read this safety information and this *Control User Guide* carefully.

The STOP functions of the drive do not isolate dangerous voltages from the output of the drive or from any external option unit. The supply must be disconnected by an approved electrical isolation device before gaining access to the electrical connections.

# None of the drive functions must be used to ensure safety of personnel, i.e. they must not be used for safety-related functions.

Careful consideration must be given to the functions of the drive which might result in a hazard, either through their intended behavior or through incorrect operation due to a fault. In any application where a malfunction of the drive or its control system could lead to or allow damage, loss or injury, a risk analysis must be carried out, and where necessary, further measures taken to reduce the risk - for example, an over-speed protection device in case of failure of the speed control, or a fail-safe mechanical brake in case of loss of motor braking.

#### 1.4 Environmental limits

Instructions in the *Power Installation Guide* regarding transport, storage, installation and use of the drive must be complied with, including the specified environmental limits. Drives must not be subjected to excessive physical force.

#### 1.5 Access

Drive access must be restricted to authorized personnel only. Safety regulations which apply at the place of use must be complied with.

#### 1.6 Fire protection

The drive enclosure is not classified as a fire enclosure. A separate fire enclosure must be provided. For further information, refer to the relevant *Power Installation Guide*.

#### 1.7 Compliance with regulations

The installer is responsible for complying with all relevant regulations, such as national wiring regulations, accident prevention regulations and electromagnetic compatibility (EMC) regulations. Particular attention must be given to the cross-sectional areas of conductors, the selection of fuses or other protection, and protective ground (earth) connections.

The *Power Installation Guide* contains instruction for achieving compliance with specific EMC standards.

Within the European Union, all machinery in which this product is used must comply with the following directives:

2006/42/EC Safety of machinery.

2014/30/EU: Electromagnetic Compatibility Directive.

#### 1.8 Motor

Ensure the motor is installed in accordance with the manufacturer's recommendations. Ensure the motor shaft is not exposed.

Standard squirrel cage induction motors are designed for single speed operation. If it is intended to use the capability of the drive to run a motor at speeds above its designed maximum, it is strongly recommended that the manufacturer is consulted first.

Low speeds may cause the motor to overheat because the cooling fan becomes less effective. The motor should be installed with a protection thermistor. If necessary, an electric forced vent fan should be used.

The values of the motor parameters set in the drive affect the protection of the motor. The default values in the drive should not be relied upon.

It is essential that the correct value is entered in Pr **00.006** motor rated current. This affects the thermal protection of the motor.

#### 1.9 Mechanical brake control

The brake control functions are provided to allow well co-ordinated operation of an external brake with the drive. While both hardware and software are designed to high standards of quality and robustness, they are not intended for use as safety functions, i.e. where a fault or failure would result in a risk of injury. In any application where the incorrect operation of the brake release mechanism could result in injury, independent protection devices of proven integrity must also be incorporated.

#### 1.10 Adjusting parameters

Some parameters have a profound effect on the operation of the drive. They must not be altered without careful consideration of the impact on the controlled system. Measures must be taken to prevent unwanted changes due to error or tampering.

information	information	installation	installation	started	parameters	motor	Optimization	Card	parameters	Diagnostics	OL LISTING

#### 1.11 Electrical installation

#### 1.11.1 Electric shock risk

The voltages present in the following locations can cause severe electric shock and may be lethal:

AC supply cables and connections

Output cables and connections

Many internal parts of the drive, and external option units

Unless otherwise indicated, control terminals are single insulated and must not be touched.

#### 1.11.2 Stored charge

The drive contains capacitors that remain charged to a potentially lethal voltage after the AC supply has been disconnected. If the drive has been energized, the AC supply must be isolated at least ten minutes before work may continue.

#### 1.12 Hazard

#### 1.12.1 Falling hazard

The drive presents a falling or toppling hazard. This can cause injury to personnel and therefore should be handled with care.

### 2 Product information

#### 2.1 Introduction

#### Open loop AC drive

Unidrive M200 and Unidrive M201 deliver maximum machine performance with open loop vector and sensorless induction motor control, for dynamic and efficient machine operation.

#### **Features**

- · Flexible machine integration through communications
- · NV Media Card for parameter copying and data storage
- 24 Vdc backup supply (optional)
- EIA 485 serial communications interface (optional)

#### 2.2 Model number

The way in which the model numbers for the Unidrive M range are formed is illustrated below:

Figure 2-1 Model number

**Product** Safety Mechanica Running the NV Media Optimization Diagnostics **UL** Listina information information installation installation started parameters motor Card parameters

### 2.3 Ratings

The size 1 to 4 drive is Heavy Duty rated only.

The size 5 to 9 drive is dual rated.

The setting of the motor rated current determines which rating applies - Heavy Duty or Normal Duty.

The two ratings are compatible with motors designed to IEC60034. The graph aside illustrates the difference between Normal Duty and Heavy Duty with respect to continuous current rating and short term overload limits.

#### **Normal Duty**

For applications which use Self ventilated (TENV/TEFC) induction motors and require a low overload capability, and full torque at low speeds is not required (e.g. fans, pumps).

Self ventilated (TENV/TEFC) induction motors require increased protection against overload due to the reduced cooling effect of the fan at low speed. To provide the correct level of protection the  $\rm l^2t$  software operates at a level which is speed dependent. This is illustrated in the graph below.

#### NOTE

The speed at which the low speed protection takes effect can be changed by the setting of *Low Speed Thermal Protection Mode* (04.025). The protection starts when the motor speed is below 15 % of base speed when Pr 04.025 = 0 (default) and below 50 % when Pr 04.025 = 1.

#### **Heavy Duty (default)**

For constant torque applications or applications which require a high overload capability, or full torque is required at low speeds (e.g. winders, hoists).

The thermal protection is set to protect force ventilated induction motors by default.

#### NOTE

If the application uses a self ventilated (TENV/TEFC) induction motor and increased thermal protection is required for speeds below 50 % base speed, then this can be enabled by setting *Low Speed Thermal Protection Mode* (04.025) = 1.

#### Operation of motor I<sup>2</sup>t protection

Motor I<sup>2</sup>t protection is fixed as shown below and is compatible with:

· Self ventilated (TENV/TEFC) induction motors

Motor I<sup>2</sup>t protection defaults to be compatible with:

Forced ventilation induction motors

information	information	installation	installation	started	parameters	motor	Optimization	Card	parameters	Diagnostics	UL Listing

### 2.4 Operating modes

The drive is designed to operate in any of the following modes:

1. Open loop mode

Open loop vector mode Fixed V/F mode (V/Hz) Square V/F mode (V/Hz)

2. RFC - A

Without position feedback sensor

#### 2.4.1 Open loop mode

The drive applies power to the motor at frequencies varied by the user. The motor speed is a result of the output frequency of the drive and slip due to the mechanical load. The drive can improve the speed control of the motor by applying slip compensation. The performance at low speed depends on whether V/F mode or open loop vector mode is selected.

#### Open loop vector mode

The voltage applied to the motor is directly proportional to the frequency except at low speed where the drive uses motor parameters to apply the correct voltage to keep the flux constant under varying load conditions.

Typically 100 % torque is available down to 1 Hz for a 50 Hz motor.

#### Fixed V/F mode

The voltage applied to the motor is directly proportional to the frequency except at low speed where a voltage boost is provided which is set by the user. This mode can be used for multi-motor applications.

Typically 100 % torque is available down to 4 Hz for a 50 Hz motor.

#### Square V/F mode

The voltage applied to the motor is directly proportional to the square of the frequency except at low speed where a voltage boost is provided which is set by the user. This mode can be used for running fan or pump applications with quadratic load characteristics or for multi-motor applications. This mode is not suitable for applications requiring a high starting torque.

#### 2.4.2 RFC-A mode

Rotor Flux Control for Asynchronous (induction) motors (RFC-A) encompasses closed loop vector control without a position feedback device

Rotor flux control provides closed loop control without the need for position feedback by using current, voltages and key motor parameters to estimate the motor speed. It can eliminate instability traditionally associated with open loop control for example when operating large motors with light loads at low frequencies.

### 2.5 Keypad and display

The keypad and display provide information to the user regarding the operating status of the drive and trip codes, and provide the means for changing parameters, stopping and starting the drive, and the ability to perform a drive reset.

#### 2.6 Nameplate description

Figure 2-4 Typical drive rating labels for size 2

Refer to Figure 2-1 Model number on page 9 for further information relating to the labels.

#### NOTE

#### Date code format

The date code is split into two sections: a letter followed by a number. The letter indicates the year, and the number indicates the week number (within the year) in which the drive was built. The letters go in alphabetical order, starting with A in 1991 (B in 1992, C in 1993 etc).

#### Example

A date code of **W28** would correspond to week 28 of year 2013.

#### 3 **Mechanical installation**

#### 3.1 Installing / removing options

Power down the drive before installing / removing the SI option module. Failure to do so may result in damage to the product.

Installation of an SI option module (size 2 to 4) Figure 3-1

#### Installing the option module

- With the option module tilted slightly backwards, align and locate the two holes in the rear of the option module onto the two tabs (1) on the drive.
- Press the option module onto the drive as shown in (2) until the connector mates with the drive, ensuring that the tab (3) retains the option module in place.

Check that the option module is securely located on the drive. Always ensure that the terminal cover is always replaced before use as this ensures that the option module is firmly secured.

Figure 3-2 Removing the SI-Option module (size 2 to 4)

- Press down on the tab (1) to release the option module from the drive housing as shown.
- Tilt the option module slightly towards you and pull away from the drive housing (2).

Figure 3-3 Installation of an SI option module (size 5 to 9)

- Move the option module in the direction shown (1).
- Align and insert the option module tab into the slot provided (2), This is shown in the detailed view (A).
- Press down on the option module until it clicks in place.

Figure 3-4 Removal of an SI option module (size 5 to 9)

- · To release the option module from the drive housing, press down on the tab (1) as shown in detailed view (A).
- Tilt the option module towards you as shown in (2).
- Remove the option module by lifting away from the drive as shown in (3).

information	information	installation	installation	started	parameters	motor	Optimization	Card	parameters	Diagnostics	UL Listing

Figure 3-5 Installing the Al-485 / Al-Backup Adaptor to the drive (Al-485 Adaptor shown)

- Identify the two plastic fingers on the underside of the Al-485 / Al-Backup Adaptor (1) then insert the two fingers into the corresponding slots in the spring-loaded sliding cover on the top of the drive.
- Hold the adaptor firmly and push the spring loaded protective cover towards the back of the drive to expose the connector block (2) below.
- Press the adaptor downwards (3) until the adaptor connector locates into the drive connection below.

Figure 3-6 Removal of the Al-485 / Al-Backup Adaptor adaptor (Al-485 Adaptor shown)

To remove the Al-485 / Al-Backup Adaptor, pull it up away from the drive in the direction shown (1)

### 3.2 Real time clock battery replacement

Those keypads which have the real time clock feature contain a battery to ensure the clock works when the drive is powered down. The battery has a long life time but if the battery needs to be replaced or removed, follow the instructions below.

Low battery voltage is indicated by 📋 low battery symbol on the keypad display.

Figure 3-7 Remote Keypad RTC (rear view)

Figure 3-7 above illustrates the rear view of the Remote Keypad RTC.

- 1. To remove the battery cover insert a flat head screwdriver into the slot as shown (1), push and turn anti-clockwise until the battery cover is released.
- 2. Replace the battery (the battery type is: CR2032).
- 3. Reverse point 1 above to replace battery cover.

#### NOTE

Ensure the battery is disposed of correctly.

Safety Product Mechanical information installation instal

### 4 Electrical installation

### 4.1 24 Vdc supply

The 24 Vdc supply connected to the +24 V supply terminals on the Al-Backup adaptor provides the following functions:

- It can be used as a back-up power supply to keep the control circuits
  of the drive powered up when the line power supply is removed. This
  allows any fieldbus modules or serial communications to continue to
  operate. If the line power supply is re-applied, then the normal
  operation can carry on after the drive automatically re-initializes the
  power board parameters.
- It can be used to clone or load parameters in order to pre-configure
  drives when the line power supply is not available. The keypad can
  be used to setup parameters if required. However, the drive will be in
  the Under Voltage state unless the line power supply is enabled,
  therefore diagnostics may not be possible. (Power down save
  parameters are not saved when using the 24 V back-up power
  supply input).

The working voltage range of the 24 V back-up power supply is as follows:

0 V	0 V (connected internally to 0V common - Control terminal 1)								
+ 24 V	+ 24 V Backup supply input								
Nominal	Nominal operating voltage 24.0 Vdc								
Minimur	Minimum continuous operating voltage 19.2 V								
Maximu	m continuous operating voltage	30.0 V							
Minimur	Minimum start up voltage 12.0 V								
Minimur	Minimum power supply requirement at 24 V 20 W								
Recomn	nended fuse	1 A, 50 Vdc							

Minimum and maximum voltage values include ripple and noise. Ripple and noise values must not exceed  $5\,\%$ .

Figure 4-1 Location of the 24 Vdc power supply connection on the Al-Backup adaptor

#### 4.2 Communication connections

Installing an Al-485 Adaptor provides the drive with a 2 wire EIA 485 serial communications interface. This enables the drive set-up, operation and monitoring to be carried out with a PC or controller as required.

Figure 4-2 Location of the Al-485 Adaptor option

#### 4.2.1 EIA 485 serial communications

The drive only supports Modbus RTU protocol. See Table 4-1 for the connection details.

#### NOTE

Standard Ethernet cables **must not be used** when connecting drives on a EIA 485 network as they do not have the correct twisted pairs for the pinout of the serial comms port.

Table 4-1 Serial communication port pin-outs (RJ45)

Pin	Function
1	120 Ω Termination resistor
2	RX TX
3	0 V
4	+24 V (100 mA) output
5	Not connected
6	TX enable
7	RX\ TX\
8	RX\ TX\ (if termination resistors are required, link to pin 1)

Minimum number of connections are 2, 3, 7 and shield.

Table 4-2 Serial communication port pin-outs (screw terminal block)

Pin	Function
1	0 V
2	RX\ TX\ (if termination resistor required, link to pin 4)
3	RX TX
4	120 Ω Termination resistor
5	TX Enable
6	+24 V (100 mA) output

#### NOTE

The connections on the RJ45 connector and terminal block are in parallel.

Product Mechanica Running the Optimization NV Media Card Diagnostics **UL** Listina installation motor information information installation parameters narameters

#### 4.2.2 Isolation of the EIA 485 serial communication

The serial communication port is single insulated and meets the requirements for ELV.

When using the communications port with a personal computer or centralised controller e.g. PLC, an isolation device must be included with a rated voltage at least equal to the drive supply voltage. Ensure that the correct fuses are installed at the drive input, and that the drive is connected to the correct supply voltage.

If a serial communications converter other than the CT Comms cable is used to connect to other circuits classified as Safety Extra Low Voltage (SELV) (e.g. to a personal computer), then a safety isolating barrier must be included to maintain the SELV classification.

An isolated serial communications lead has been designed to connect the drive to IT equipment (such as laptop computers), and is available from the supplier of the drive. See below for details:

Table 4-3 Isolated serial comms lead details

Part number	Description
4500-0096	CT USB Comms cable

The "isolated serial communications" lead has reinforced insulation as defined in IEC60950 for altitudes up to 3,000 m.

#### 4.3 Control connections

#### 4.3.1 General

Table 4-4 The control connections consist of:

Function	Qty	Control parameters	Terminal
		available	number
Single ended analog input	2	Mode, offset, invert, scaling, destination	2, 5
Analog output	1	Source, mode, scaling,	7
Digital input	5	Destination, invert	5, 11, 12, 13, 14
Digital input / output	1	Input / output mode select, destination / source, invert	10
Frequency input	1	Maximum reference, input limit, scaling, destination	14
PWM or frequency output	1	Source, scaling, maximum output frequency, mode	10
Motor thermistor input	1	Mode, type, trip threshold, reset threshold	14
Relay	1	Source, invert	41, 42
Drive enable	1		11
+10 V User output	1		4
+24 V User output	1		9
0V common	1		1

#### Key:

Destination parameter:	Indicates the parameter which is being controlled by the terminal / function
Source parameter:	Indicates the parameter being output by the terminal
Mode parameter:	Analog - indicates the mode of operation of the terminal, i.e. voltage 0-10 V, current 4-20 mA etc. Digital - indicates the mode of operation of the terminal, (the Drive Enable terminal is fixed in positive logic).

All analog terminal functions can be programmed in menu 7.

All digital terminal functions (including the relay) can be programmed in menu 8.

The control circuits are isolated from the power circuits in the drive by basic insulation (single insulation) only. The installer must ensure that the external control circuits are insulated from human contact by at least one layer of insulation (supplementary insulation) rated for use at the AC supply voltage.

If the control circuits are to be connected to other circuits classified as Safety Extra Low Voltage (SELV) (e.g. to a personal computer), an additional isolating barrier must be included in order to maintain the SELV classification.

If any of the digital inputs (including the drive enable input) are connected in parallel with an inductive load (i.e. contactor or motor brake) then suitable suppression (i.e. diode or varistor) should be used on the coil of the load. If no suppression is used then over voltage spikes can cause damage to the digital inputs and outputs on the drive.

#### NOTE

Any signal cables which are carried inside the motor cable (i.e. motor thermistor, motor brake) will pick up large pulse currents via the cable capacitance. The shield of these signal cables must be connected to ground close to the point of exit of the motor cable, to avoid this noise current spreading through the control system.

Figure 4-3 Default terminal functions

1	0V common	
Func	tion	Common connection for all external devices

2 Analog input 1		
Default function	Frequency reference	
Type of input	Unipolar single-ended analog voltage or unipolar current	
Mode controlled by	Pr <b>07.007</b>	
Operating in voltage mode (default)		
Full scale voltage range	0 V to +10 V ±3 %	
Maximum offset	±30 mV	
Absolute maximum voltage range	-18 V to +30 V relative to 0 V	
Input resistance	100 kΩ	
Operating in current mode		
Current ranges	0 to 20 mA ±5 %, 20 to 0 mA ±5 %, 4 to 20 mA ±5 %, 20 to 4 mA ±5 %	
Maximum offset	250 μΑ	
Absolute maximum voltage (reverse bias)	-18 V to +30 V relative to 0 V	
Absolute maximum current	25 mA	
Equivalent input resistance	165 Ω	
Common to all modes		
Resolution	11 bits	
Sample rate	4 ms	

4 +10 V user output	
Default function	Supply for external analog devices
Nominal voltage	10.2 V
Voltage tolerance	±3 %
Maximum output current	5 mA

5 Analog input 2			
Default function	Frequency reference		
Type of input	Unipolar single-ended analog voltage or positive logic only digital input		
Mode controlled by	Pr <b>07.011</b>		
Operating in voltage mode (default)			
Full scale voltage range	0 V to +10 V ±3 %		
Maximum offset	±30 mV		
Absolute maximum voltage range	-18 V to +30 V relative to 0 V		
Input resistance	100 kΩ		
Resolution	11 bits		
Sample rate	4 ms		
Operating in digital mode			
Absolute maximum voltage range	-18 V to +30 V relative to 0 V		
Impedance	6.8 kΩ		
Input threshold	10 V ±0.8 V (IEC 61131-2)		
Sample rate	1 ms when routed to destinations Pr <b>06.035</b> or Pr <b>06.036</b> , otherwise 4 ms.		

7 Analog output 1	
Default function	Frequency output
Type of output	Unipolar single-ended analog voltage
Voltage range	+10 V
Maximum offset	15 mV
Load resistance	≥ 2 kΩ
Protection	Short circuit relative to 0 V
Resolution	0.1 %
Sample rate	4 ms

9 +24 V user output	
Default function	Supply for external digital devices
Voltage tolerance	±20 %
Maximum output current	100 mA
Protection	Current limit and trip

10 Digital I/O 1				
Default function	AT ZERO FREQUENCY output			
Туре	Positive logic digital input, positive logic voltage source output. PWM or frequency output modes can be selected.			
Input / output mode controlled by	Pr <b>08.031</b>			
Operating as in input				
Absolute maximum applied voltage range	-8 V to +30 V relative to 0 V			
Impedance	6.8 kΩ			
Input threshold	10 V ±0.8 V (IEC 61131-2)			
Operating as an output				
Nominal maximum output current	50 mA			
Maximum output current	100 mA (total including +24 Vout)			
Common to all modes				
Voltage range	0 V to +24 V			
Sample rate	1 ms when routed to destinations Pr 06.035 or Pr 06.036, otherwise 4 ms

Voltage range	0 V to +24 V
Absolute maximum applied voltage range	-18 V to +30 V relative to 0 V
Impedance	6.8 kΩ
Input threshold	10 V ±0.8 V (IEC 61131-2)
Sample rate	1 ms when routed to destinations Pr <b>06.035</b> or Pr <b>06.036</b> , otherwise 4 ms.

41 Relay contacts	
Default function	Drive OK indicator
Contact voltage rating	240 Vac, Installation over-voltage category II
Contact maximum current rating	2 A AC 240 V 4 A DC 30 V resistive load 0.5 A DC 30 V inductive load (L/R = 40 ms)
Contact minimum recommended rating	12 V 100 mA
Contact type	Normally open
Default contact condition	Closed when power applied and drive OK
Update rate	1 ms

To prevent the risk of a fire hazard in the event of a fault, a fuse or other over-current protection must be installed in the relay circuit.

Getting started Safety Product Mechanical Electrica Running the Optimization NV Media Card Diagnostics **UL** Listina information motor information installation inetallation parameters parameters

### 5 Getting started

This chapter introduces the user interfaces, menu structure and security levels of the drive.

### 5.1 Understanding the display

#### 5.1.1 Keypad

The keypad display consists of a 6 digit LED display. The display shows the drive status or the menu and parameter number currently being edited.

The option module Unidrive menu (S.mm.ppp) is only displayed if the option module is installed. Where S signifies the option module slot number and the mm.ppp signifies the menu and parameter number of the option module's internal menus and parameter.

The display also includes LED indicators showing units and status as shown in Figure 5-1. When the drive is powered up, the display will show the power up parameter defined by *Parameter Displayed At Power-Up* (11.022).

#### NOTE

The values in the *Status Mode Parameters* (11.018 and 11.019) shown on the display when the drive is running, can be toggled by using the escape button.

Figure 5-1 Unidrive M200 keypad detail

- 1. Escape button
- 2. Down button
- 3. Start button (green)
- 4. Stop / Reset button (red)
- 5. Up button
- 6. Enter button
- 7. Run forward indicator
- 8. Run reverse indicator
- 9. Keypad reference indicator
- 10. Unit indicators

Figure 5-2 Unidrive M201 keypad detail

- 1. Run forward indicator
- 2. Unit indicators
- Speed reference potentiometer
- 4. Keypad reference indicator
- 5. Run reverse indicator

#### NOTE

The red stop button is also used to reset the drive.

The parameter value is correctly displayed on the keypad display as shown in Table 5-1.

On the *Unidrive M201*, the speed reference potentiometer is used to adjust the keypad reference.

Table 5-1 Keypad display formats

Display formats	Value
Standard	100.99
Date	31.12.11 or 12.31.11
Time	12.34.56
Character	ABCDEF
Binary	5
IP Address	192.168 88.1*
MAC Address	01.02.03 04.05.06*
Version number	01.23.45

<sup>\*</sup>Alternate display

#### 5.2 Keypad operation

#### 5.2.1 Control buttons

The keypad consists of:

- Up and down button Used to navigate the parameter structure and change parameter values.
- Enter button Used to change between parameter edit and view mode as well as entering data. This button can also be used to select between slot menu and parameter display.
- Escape button Used to exit from parameter edit or view mode. In parameter edit mode, if parameter values are edited and the escape button pressed, the parameter value will be restored to the value it had on entry to edit mode.
- Start button Used to provide a 'Run' command if keypad mode is selected.
- Stop / Reset button Used to reset the drive. In keypad mode can be used for 'Stop'.

Safety Product information installation inst

Figure 5-3 Display modes

NOTE

The up and down buttons can only be used to move between menus if Pr **00.010** has been set to show 'ALL'. Refer to section 5.9 *Parameter access level and security* on page 27.

Getting started Running the Safety Product Mechanica Electrica Optimization NV Media Card Diagnostics **UL** Listina information information installation installation parameters motor parameters

Figure 5-4 Mode examples

- Parameter view mode: Read write or Read only 1
- Status mode: Drive OK status 2

If the drive is ok and the parameters are not being edited or viewed, the display will show one of the following:

inh', 'rdy' or status mode parameter value.

Status mode: Trip status

When the drive is in trip condition, the display will indicate that the drive has tripped and the display will show the trip code. For further information regarding trip codes, refer to section 11.4 Trips, Sub-trip numbers on page 128.

Status mode: Alarm status

During an 'alarm' condition the display flashes between the drive status parameter value and the alarm.

Do not change parameter values without careful consideration; incorrect values may cause damage or a safety hazard.

When changing the values of parameters, make a note of the new values in case they need to be entered again.

New parameter values must be saved to ensure that the new values apply after the drive has been power cycled. Refer to section 5.7 Saving parameters on page 26.

#### 5.3 Menu structure

The drive parameter structure consists of menus and parameters.

The drive initially powers up so that only Menu 0 can be viewed. The up and down arrow buttons are used to navigate between parameters and once Pr 00.010 has been set to 'All' the up and down buttons are used to navigate between menus.

For further information refer to section 5.9 Parameter access level and security on page 27.

The menus and parameters rollover in both directions i.e. if the last parameter is displayed, a further press will cause the display to rollover and show the first parameter.

When changing between menus, the drive remembers which parameter was last viewed in a particular menu and thus displays that parameter.

#### 5.4

Menu 0 is used to bring together various commonly used parameters for basic easy set up of the drive. The parameters displayed in Menu 0 can be configured in Menu 22.

Appropriate parameters are copied from the advanced menus into Menu 0 and thus exist in both locations.

For further information, refer to Chapter 6 Basic parameters on page 29.

Figure 5-5 Menu 0 copying

Safety Product Mechanica Running the Optimization NV Media Card Diagnostics **UL** Listina started information information installation installation parameters motor parameters

#### 5.5 Advanced menus

The advanced menus consist of groups or parameters appropriate to a specific function or feature of the drive. Menus 0 to 24 can be viewed on the Keypad.

The option module menu (1.mm.ppp) is only displayed if the option module is installed. Where 1 signifies the option module slot number and the mm.ppp signifies the menu and parameter number of the option module's internal menus and parameters.

Table 5-2 Advanced menu descriptions

Menu	Description
0	Commonly used basic set up parameters for quick / easy
	programming
1	Frequency reference
2	Ramps
3	Frequency control
4	Torque and current control
5	Motor control
6	Sequencer and clock
7	Analog I/O
8	Digital I/O
9	Programmable logic, motorized pot, binary sum, timers
10	Status and trips
11	Drive set-up and identification, serial communications
12	Threshold detectors and variable selectors
14	User PID controller
15	Option module slot 1 set-up menu
18	General option module application menu 1
20	General option module application menu 2
21	Second motor parameters
22	Menu 0 set-up
24	Option module slot 1 application menu
Slot 1	Slot 1 option menus*

<sup>\*</sup> Only displayed when the option module is installed.

#### 5.5.1 Display messages

The following tables indicate the various possible mnemonics which can be displayed by the drive and their meaning.

Table 5-3 Status indications

String	Description	Drive output stage	
inh	The drive is inhibited and cannot be run. The Drive Enable signal is not applied to the drive enable terminal or Pr <b>06.015</b> is set to 0. The other conditions that can prevent the drive from enabling are shown as bits in <i>Enable Conditions</i> (06.010)	Disabled	
rdy	The drive is ready to run. The drive enable is active, but the drive inverter is not active because the final drive run is not active	Disabled	
Stop	The drive is stopped / holding zero speed.	Enabled	
S.Loss	Supply loss condition has been detected	Enabled	
dc inj	The drive is applying dc injection braking	Enabled	
Er	The drive has tripped and no longer controlling the motor. The trip code appears on the display.	Disabled	
UV	The drive is in the under voltage state either in low voltage or high voltage mode.		
HEAt	The motor pre-heat function is active.	Enabled	

#### 5.5.2 Alarm indications

An alarm is an indication given on the display by alternating the alarm string with the drive status string on the display. Alarms strings are not displayed when a parameter is being edited.

Table 5-4 Alarm indications

Alarm string	Description
br.res	Brake resistor overload. <i>Braking Resistor Thermal Accumulator</i> (10.039) in the drive has reached 75.0 % of the value at which the drive will trip.
OV.Ld	Motor Protection Accumulator (04.019) in the drive has reached 75.0 % of the value at which the drive will trip and the load on the drive is >100 %.
d.OV.Ld	Drive over temperature. <i>Percentage Of Drive Thermal Trip Level</i> (07.036) in the drive is greater than 90 %.
tuning	The autotune procedure has been initialized and an autotune in progress.
LS	Limit switch active. Indicates that a limit switch is active and that is causing the motor to be stopped.
Opt.Al	Option slot alarm.
Lo.AC	Low voltage mode. See Low AC Alarm (10.107).
I.AC.Lt	Current limit active. See Current Limit Active (10.009).
24.LoSt	24 V backup not present. See 24V Alarm Loss Enable (11.098).

### 5.6 Changing the operating mode

#### **Procedure**

Use the following procedure only if a different operating mode is required:

- Ensure the drive is not enabled, i.e. terminal 11 is open or Pr 06.015 is OFF (0)
- 2. Change the setting of Pr 00.079 as follows:

Pr 00.079 setting	Operating mode	
BPEnLP	Open-loop	
17 F E - R	2	RFC-A

The figures in the second column apply when serial communications are used.

#### NOTE

When the operating mode is changed, a parameter save is carried out.

3. Either:

Press the red reset button

Carry out a drive reset through serial communications by setting Pr 10.038 to 100.

#### 5.7 Saving parameters

When changing a parameter in Menu 0, the new value is saved when pressing the Enter button to return to parameter view mode from parameter edit mode.

If parameters have been changed in the advanced menus, then the change will not be saved automatically. A save function must be carried out.

#### **Procedure**

- Select 'Save' in Pr mm.000 (alternatively enter a value of 1001 in Pr mm.000)
- 2. Either:
- Press the red reset button
- Carry out a drive reset through serial communications by setting Pr 10.038 to 100

Safety Product information installation inst

### 5.8 Restoring parameter defaults

Restoring parameter defaults by this method saves the default values in the drives memory. *User security status* (00.010) and *User security code* (00.025) are not affected by this procedure).

#### **Procedure**

- Ensure the drive is not enabled, i.e. drive is in inhibit or under voltage state.
- Select 'Def.50' or 'Def.60' in Pr mm.000. (alternatively, enter 1233 (50 Hz settings) or 1244 (60 Hz settings) in Pr mm.000).
- Either
- Press the red reset button
- Carry out a drive reset through serial communications by setting Pr 10.038 to 100

#### 5.9 Parameter access level and security

The parameter access level determines whether the user has access to Menu 0 only or to all the advanced menus (Menus 1 to 24) in addition to Menu 0.

The User Security determines whether the access to the user is read only or read write.

Both the User Security and Parameter Access Level can operate independently of each other as shown in Table 5-5.

Table 5-5 Parameter access level and security

User security status (00.010)	Access level	User security (00.025)	Menu 0 status	Advanced menu status
0	Menu 0	None	RW	Not visible
1	All Menus	None	RW	RW
2	Read-only	Open	RW	Not visible
2	Menu 0	Closed	RO	Not visible
3	Read-only	Open	RW	RW
3	Tread-only	Closed	RO	RO
4	Status only	Open	RW	RW
7	Ciaids Offig	Closed	Not visible	Not visible
5	No access	Open	RW	RW
3	140 000000	Closed	Not visible	Not visible

The default settings of the drive are Parameter Access Level Menu 0 and user Security Open i.e. read / write access to Menu 0 with the advanced menus not visible.

#### 5.9.1 User Security Level / Access Level

The drive provides a number of different levels of security that can be set by the user via *User Security Status* (00.010); these are shown in the table below.

User Security Status (Pr 00.010)	Description
LEVEL.0 (0)	All writable parameters are available to be edited but only parameters in Menu 0 are visible
ALL (1)	All parameters are visible and all writable parameters are available to be edited
r.only.0 (2)	Access is limited to Menu 0 parameters only. All parameters are read-only
r.only.A (3)	All parameters are read-only however all menus and parameters are visible
Status (4)	The keypad remains in status mode and no parameters can be viewed or edited
no.acc (5)	The keypad remains in status mode and no parameters can be viewed or edited. Drive parameters cannot be accessed via a comms interface

## 5.9.2 Changing the User Security Level /Access Level

The security level is determined by the setting of Pr **00.010** or Pr **11.044**. The Security Level can be changed through the keypad even if the User Security Code has been set.

#### 5.9.3 User Security Code

The User Security Code, when set, prevents write access to any of the parameters in any menu.

#### **Setting User Security Code**

Enter a value between 1 and 9999 in Pr 00.025 and press the button; the security code has now been set to this value. In order to activate the security, the Security level must be set to desired level in Pr 00.010. When the drive is reset, the security code will have been activated and the drive returns to Menu 0. The value of Pr 00.025 will return to 0 in order to hide the security code.

#### **Unlocking User Security Code**

Select a parameter that need to be edited and press the button, the display will now show 'Co'. Use the arrow buttons to set the security code and press the button. With the correct security code entered, the display will revert to the parameter selected in edit mode.

If an incorrect security code is entered, the following message 'Co.Err' is displayed, and the display will revert to parameter view mode.

#### **Disabling User Security**

Unlock the previously set security code as detailed above. Set Pr 00.025 to 0 and press the button. The User Security has now been disabled, and will not have to be unlocked each time the drive is powered up to allow read / write access to the parameters.

### 5.10 Displaying parameters with nondefault values only

By selecting 'diff.d' in Pr mm.000 (Alternatively, enter 12000 in Pr mm.000), the only parameters that will be visible to the user will be those containing a non-default value. This function does not require a drive reset to become active. In order to deactivate this function, return to Pr mm.000 and select 'none' (alternatively enter a value of 0). Please note that this function can be affected by the access level enabled, refer to section 5.9 *Parameter access level and security* on page 27 for further information regarding access level.

Safety	Product	Mechanical	Electrical	Getting	Basic	Running the	Optimization	NV Media Card	Advanced	Diagnostics	UL Listina
information	information	installation	installation	started	parameters	motor	Optimization	INV Media Calu	parameters	Diagnostics	OL LISTING

#### 5.11 Displaying destination parameters only

By selecting 'dest' in Pr mm.000 (Alternatively enter 12001 in Pr mm.000), the only parameters that will be visible to the user will be destination parameters. This function does not require a drive reset to become active. In order to deactivate this function, return to Pr mm.000 and select 'none' (alternatively enter a value of 0).

Please note that this function can be affected by the access level enabled, refer to section 5.9 *Parameter access level and security* on page 27 for further information regarding access level.

#### 5.12 Communications

Installing an AI-485 Adaptor provides the drive with a 2 wire EIA 485 serial communications interface. This enables the drive set-up, operation and monitoring to be carried out with a PC or controller as required.

#### 5.12.1 EIA 485 Serial communications

Communication is via the RJ45 connector or screw terminals (parallel connection). The drive only supports Modbus RTU protocol.

The communications port applies a 1.25 unit load to the communications network.

#### **USB to EIA 485 Communications**

An external USB hardware interface such as a PC cannot be used directly with the 2-wire EIA 485 interface of the drive. Therefore a suitable converter is required.

A suitable USB to EIA 485 isolated converter is available from Control Techniques as follows:

· CT USB Comms cable (CT Part No. 4500-0096)

When using the above converter or any other suitable converter with the drive, it is recommended that no terminating resistors be connected on the network. It may be necessary to 'link out' the terminating resistor within the converter depending on which type is used. The information on how to link out the terminating resistor will normally be contained in the user information supplied with the converter.

#### Serial communications set-up parameters

The following parameters need to be set according to the system requirements.

		Serial communications set-up parameters
Serial Mode (11.024)	8 2 NP (0), 8 1 NP (1), 8 1 EP (2), 8 1 OP (3), 8 2 NP M (4), 8 1 NP M (5), 8 1 EP M (6), 8 1 OP M (7), 7 1 EP (8), 7 1 OP (9), 7 1 EP M (10), 7 1 OP M (11)	The drive only supports the Modbus RTU protocol and is always a slave. This parameter defines the supported data formats used by the EIA 485 comms port (if installed) on the drive. This parameter can be changed via the drive keypad, via a option module or via the comms interface itself.
Serial Baud Rate (00.043)	600 (1), 1200 (2), 2400 (3), 4800 (4), 9600 (5), 19200 (6), 38400 (7), 57600(8), 76800(9), 115200 (10)	This parameter can be changed via the drive keypad, via a option module or via the comms interface itself. If it is changed via the comms interface, the response to the command uses the original baud rate. The master should wait at least 20 ms before sending a new message using the new baud rate.
Serial Address (00.044)	1 to 247	This parameter defines the serial address and an addresses between 1 and 247 are permitted.
Reset Serial Communications (00.045)	Off (0) or On (1)	When the above parameters are modified the changes do not have an immediate effect on the serial communication system. The new values are used after the next power up or if Reset Serial Communications is set to 1.

## 6 Basic parameters

Menu 0 is used to bring together various commonly used parameters for basic easy set up of the drive. All the parameters in Menu 0 appear in other menus in the drive (denoted by  $\{...\}$ ). Menu 22 can be used to configure the parameters in Menu 0.

#### Parameter ranges and Variable minimum/maximums:

Some parameters in the drive have a variable range with a variable minimum and a variable maximum value which is dependent on one of the following:

- The settings of other parameters
- The drive rating
- · The drive mode
- · Combination of any of the above

For more information please see section 10.1 Parameter ranges and Variable minimum/maximums: on page 72.

### 6.2 Parameter descriptions

#### 6.2.1 Pr mm.000

Pr mm.000 is available in all menus, commonly used functions are provided as text strings in Pr mm.000 shown in Table 6-1. The functions in Table 6-1 can also be selected by entering the appropriate numeric values (as shown in Table 6-2) in Pr mm.000. For example, enter 4001 in Pr mm.000 to store drive parameters on an NV media card.

Table 6-1 Commonly used functions in xx.000

Value	Equivalent value	String	Action
0	0	None	No action
1001	1	SAVE	Save drive parameters to non-volatile memory
6001	2	LOAd.1	Load the data from file 1 on a non-volatile media card into the drive provided it is a parameter file
4001	3	SAVE.1	Store the drive parameters in file 1 on a non-volatile media card
6002	4	LOAd.2	Load the data from file 2 on a non-volatile media card into the drive provided it is a parameter file
4002	5	SAVE.2	Store the drive parameters in file 2 on a non-volatile media card
6003	6	LOAd.3	Load the data from file 3 on a non-volatile media card into the drive provided it is a parameter file
4003	7	SAVE.3	Store the drive parameters in file 3 on a non-volatile media card
12000	8	diff.d	Only display parameters that are different from their default value
12001	9	dest	Only display parameters that are used to set-up destinations
1233	10	def.50	Load 50 Hz defaults
1244	11	def.60	Load 60 Hz defaults
1070	12	rst.opt	Reset option module

Table 6-2 Functions in Pr mm.000

Value	Action
1000	Save parameters when <i>Under Voltage Active</i> (Pr <b>10.016</b> ) is not active.
1001	Save parameters under all conditions
1070	Reset option module
1233	Load standard (50 Hz) defaults
1234	Load standard (50 Hz) defaults to all menus except option module menu 15
1244	Load US (60 Hz) defaults
1245	Load US (60 Hz) defaults to all menus except option module menu 15
1299	Reset {St.HF} trip.
2001*	Create a boot file on a non-volatile media card based on the present drive parameters including all Menu 20 parameters
4yyy*	NV media card: Transfer the drive parameters to parameter file yyy
6ууу*	NV media card: Load the drive parameters from parameter file yyy
7yyy*	NV media card: Erase file yyy
8yyy*	NV Media card: Compare the data in the drive with file yyy
9555*	NV media card: Clear the warning suppression flag
9666*	NV media card: Set the warning suppression flag
9777*	NV media card: Clear the read-only flag
9888*	NV media card: Set the read-only flag
12000**	Only display parameters that are different from their default value. This action does not require a drive reset.
12001**	Only display parameters that are used to set-up destinations (i.e. DE format bit is 1). This action does not require a drive reset.

<sup>\*</sup> See Chapter 9 NV Media Card on page 65 for more information on these functions.

All other functions require a drive reset to initiate the function. Equivalent values and strings are also provided in the table above.

<sup>\*\*</sup> These functions do not require a drive reset to become active.

#### Note 1:

If last default setting was 50 Hz or in PAd or PAd.rEF configuration: Pr 06.004 is 0.

If last default setting was 60 Hz: Pr 06.004 is 4.

#### Note 2:

If last default setting was 50 Hz or in PAd or PAd.rEF configuration: Pr 08.022 is 06.038.

If last default setting was 60 Hz: Pr 08.022 is 06.039.

Value	Text	Description
0	AV	Analog input 1 (voltage) Analog input 2 (voltage) selected by terminal (Local/Remote)
1	Al	Analog input 1 (current) or Analog input 2 (voltage) selected by terminal (Local/Remote)
2	AV.Pr	Analog input 1 (voltage) or 3 presets selected by terminal
3	Al.Pr	Analog input 1 (current) or 3 presets selected by terminal
4	PrESEt	Four presets selected by terminal
5	PAd	Keypad reference
6	PAd.rEF	Keypad reference with terminal control
7	E.Pot	Electronic Potentiometer
8	torquE	Torque mode, Analog input 1 (current frequency reference) or Analog input 2 (voltage torque reference) selected by terminal
9	Pid	PID mode, Analog input 1 (current feedback source) and Analog input 2 (voltage reference source)

Action will only occur if the drive is inactive and no User Actions are running. Otherwise, the parameter will return to its pre altered value on exit from edit mode. All parameters are saved if this parameter changes.

Running the Safety Product Electrica Basic Optimization NV Media Card Diagnostics **UL** Listina information information installation installation started parameters motor parameters

## 7 Running the motor

This chapter takes the new user through all the essential steps to running a motor for the first time, in each of the possible operating modes.

For information on tuning the drive for the best performance, see *Chapter 8 Optimization on page 52*.

Ensure that no damage or safety hazard could arise from the motor starting unexpectedly.

The values of the motor parameters affect the protection of the motor

The default values in the drive should not be relied upon. It is essential that the correct value is entered in Pr **00.006** *Motor Rated Current*. This affects the thermal protection of the motor.

If the drive is started using the keypad it will run to the speed defined by the keypad reference (Pr 01.017). This may not be acceptable depending on the application. The user must check in Pr 01.017 and ensure that the keypad reference has been set to 0.

If the intended maximum speed affects the safety of the machinery, additional independent over-speed protection must be used.

## 7.1 Quick start connections

#### 7.1.1 Basic requirements

This section shows the basic connections which must be made for the drive to run in the required mode. For minimal parameter settings to run in each mode please see the relevant part of section 7.3 *Quick start commissioning / start-up* on page 50.

Table 7-1 Minimum control connection requirements for each control mode

Drive control method	Requirements
Terminal mode	Drive enable Speed / Torque reference Run forward / Run reverse
Keypad mode	Drive enable
Serial communications	Drive enable Serial communications link

## 7.2 Changing the operating mode

#### Procedure

Use the following procedure only if a different operating mode is required:

- Ensure that the drive is not enabled, i.e. drive is in inhibit or under voltage state.
- 2. Change the setting of Pr 00.079 as follows:

Pr 00.079 setting		Operating mode
OPEALP	1	Open-loop
$-f  F  \mathcal{L} + \tilde{R}$	2	RFC-A

The figures in the second column apply when serial communications are used.

- 3. Either:
- Press the red reset button
- Carry out a drive reset through serial communications by setting Pr 10.038 to 100.

### NOTE

When the operating mode is changed, a parameter save is carried out.

Autotune	The drive is able to perform either a stationary or a rotating autotune. The motor must be at a standstill before an autotune is enabled. A rotating autotune should be used whenever possible so the measured value of power factor of the motor is used by the drive.  A rotating autotune will cause the motor to accelerate up to <sup>2</sup> / <sub>3</sub> base speed in the direction selected regardless of the reference provided. Once complete the motor will coast to a stop. The enable signal must be removed before the drive can be made to run at the required reference.  The drive can be stopped at any time by removing the run signal or removing the drive enable.  A stationary autotune can be used when the motor is loaded and it is not possible to uncouple the load from the motor shaft. A stationary autotune measures the stator resistance of the motor and the dead time compensation for the drive. These are required for good performance in vector control modes. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.009.  A rotating autotune should only be used if the motor is uncoupled. A rotating autotune first performs a stationary autotune before rotating the motor at <sup>2</sup> / <sub>3</sub> base speed in the direction selected. The rotating autotune measures the power factor of the motor.  To perform an autotune:  Set Pr 00.038 = 1 for a stationary autotune or set Pr 00.038 = 2 for a rotating autotune  Close the Drive Enable signal (apply +24 V to terminal 11). The drive will display 'rdy'.  Close the run signal (apply +24 V to terminal 12 or 13). The display will flash 'tuning' while the drive is performing the autotune.  Wait for the drive to display 'inh' and for the motor to come to a standstill.  If the drive trips, see Chapter 11 <i>Diagnostics</i> on page 127. ## 8 Optimization

This chapter takes the user through methods of optimizing the drive set-up and maximize the performance. The auto-tuning features of the drive simplify the optimization tasks.

## 8.1 Motor map parameters

## 8.1.1 Open loop motor control

#### Pr 00.006 {05.007} Motor Rated Current

#### Defines the maximum continuous motor current

- · The rated current parameter must be set to the maximum continuous current of the motor. The motor rated current is used in the following:
- Current limits (see section section 8.3 Current limits on page 58, for more information)
- Motor thermal overload protection (see section section 8.4 Motor thermal protection on page 58, for more information)
- Vector mode voltage control (see Control Mode later in this table)
- Slip compensation (see *Enable Slip Compensation* (05.027), later in this table)
- Dynamic V/F control

Pr 00.008 {05.009} Motor Rated Voltage

Pr 00.039 {05.006} Motor Rated Frequency

Defines the voltage applied to the motor at rated frequency
Defines the frequency at which rated voltage is applied

The *Motor Rated Voltage* (00.008) and the *Motor Rated Frequency* (00.039) are used to define the voltage to frequency characteristic applied to the motor (see *Control Mode*, later in this table). The *Motor Rated Frequency* is also used in conjunction with the motor rated speed to calculate the rated slip for slip compensation (see *Motor Rated Speed*, later in this table).

Pr 00.007 {05.008} Motor Rated Speed

Defines the full load rated speed of the motor

Pr 00.040 {05.011} Number of Motor Poles

Defines the number of motor poles

The motor rated speed and the number of poles are used with the motor rated frequency to calculate the rated slip of induction machines in Hz.

Rated slip (Hz) = Motor rated frequency - (Number of pole pairs x [Motor rated speed / 60]) =  $00.039 = \left(\frac{00.040}{2} \times \frac{00.007}{60}\right)$ 

If Pr 00.007 is set to 0 or to synchronous speed, slip compensation is disabled. If slip compensation is required this parameter should be set to the nameplate value, which should give the correct rpm for a hot machine. Sometimes it will be necessary to adjust this when the drive is commissioned because the nameplate value may be inaccurate. Slip compensation will operate correctly both below base speed and within the field-weakening region. Slip compensation is normally used to correct for the motor speed to prevent speed variation with load. The rated load rpm can be set higher than synchronous speed to deliberately introduce speed droop. This can be useful to aid load sharing with mechanically coupled motors.

Pr **00.040** is also used in the calculation of the motor speed display by the drive for a given output frequency. When Pr **00.040** is set to 'Auto', the number of motor poles is automatically calculated from the rated frequency Pr **00.039**, and the motor rated speed Pr **00.007**.

Number of poles = 120 x (Rated Frequency (00.039) / Rated Speed (00.007)) rounded to the nearest even number.

#### Pr 00.043 {05.010} Motor Rated Power Factor

Defines the angle between the motor voltage and current

The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current. The power factor is used in conjunction with the *Motor Rated Current* (00.006), to calculate the rated active current and magnetising current of the motor. The rated active current is used extensively to control the drive, and the magnetising current is used in vector mode stator resistance compensation. It is important that this parameter is set up correctly. The drive can measure the motor rated power factor by performing a rotating autotune (see Autotune (Pr 00.038), below).

ı	information	information	installation	installation	started	parameters	motor	Optimization	Card	parameters	Diagnostics	OL LISTING

## Pr 00.038 {05.012} Autotune

There are two autotune tests available in open loop mode, a stationary and a rotating test. A rotating autotune should be used whenever possible so the measured value of power factor of the motor is used by the drive.

- A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary test measures the Stator Resistance (05.017), Transient Inductance (05.024), Maximum Deadtime Compensation (05.059) and Current At Maximum Deadtime Compensation (05.060) which are required for good performance in vector control modes (see Control Mode later in this table). The stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.009. To perform a Stationary autotune, set Pr 00.038 to 1, and provide the drive with both an enable signal (on terminal 11) and a run signal (on terminals 12 or 13).
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune, as above, then a rotating test is performed in which the motor is accelerated with currently selected ramps up to a frequency of *Motor Rated Frequency* (00.039) x 2/3, and the frequency is maintained at that level for 4 seconds. *Stator Inductance* (05.025) is measured and this value is used in conjunction with other motor parameters to calculate *Motor Rated Power Factor* (00.009). To perform a Rotating autotune, set Pr 00.038 to 2, and provide the drive with both an enable signal (on terminal 11) and a run signal (on terminals 12 or 13).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the signal from terminal 11, setting the *Drive Enable* (06.015) to OFF (0) or disabling the drive via the *Control Word* (06.042) and *Control Word Enable* (06.043).

### Pr 00.041 {05.014} Control Mode

There are several voltage modes available which fall into two categories, vector control and fixed boost.

#### Vector control

Vector control mode provides the motor with a linear voltage characteristic from 0 Hz to *Motor Rated Frequency*, and then a constant voltage above motor rated frequency. When the drive operates between motor rated frequency/50 and motor rated frequency/4, full vector based stator resistance compensation is applied. When the drive operates between motor rated frequency/4 and motor rated frequency/2 the stator resistance compensation is gradually reduced to zero as the frequency increases. For the vector modes to operate correctly the *Motor Rated Power Factor* (00.009), *Stator Resistance* (05.017), *Maximum Deadtime Compensation* (05.059) and current at *Maximum Deadtime Compensation* (05.060) are all required to be set up accurately. The drive can be made to measure these by performing an autotune (see Pr 00.038 *Autotune*). The drive can also be made to measure the stator resistance automatically every time the drive is enabled or the first time the drive is enabled after it is powered up, by selecting one of the vector control voltage modes.

- (0) **Ur S** = The stator resistance is measured and the parameters for the selected motor map are over-written each time the drive is made to run. This test can only be done with a stationary motor where the flux has decayed to zero. Therefore this mode should only be used if the motor is guaranteed to be stationary each time the drive is made to run. To prevent the test from being done before the flux has decayed there is a period of 1 second after the drive has been in the ready state during which the test is not done if the drive is made to run again. In this case, previously measured values are used. Ur S mode ensures that the drive compensates for any change in motor parameters due to changes in temperature. The new value of stator resistance is not automatically saved to the drive's EEPROM.
- (4) **Ur I** = The stator resistance is measured when the drive is first made to run after each power-up. This test can only be done with a stationary motor. Therefore this mode should only be used if the motor is guaranteed to be stationary the first time the drive is made to run after each power-up. The new value of stator resistance is not automatically saved to the drive's EEPROM.
- (1) **Ur** = The stator resistance and voltage offset are not measured. The user can enter the motor and cabling resistance into the *Stator Resistance* (05.017). However this will not include resistance effects within the drive inverter. Therefore if this mode is to be used, it is best to use an autotune test initially to measure the stator resistance.
- (3) **Ur\_Auto=** The stator resistance is measured once, the first time the drive is made to run. After the test has been completed successfully the *Control Mode* (00.041) is changed to Ur mode. The *Stator Resistance* (05.017) parameter is written to, and along with the *Control Mode* (00.041), are saved in the drive's EEPROM. If the test fails, the voltage mode will stay set to Ur Auto and the test will be repeated next time the drive is made to run.

#### **Fixed boost**

The stator resistance is not used in the control of the motor, instead a fixed characteristic with low frequency voltage boost as defined by Pr **00.042**, is used. Fixed boost mode should be used when the drive is controlling multiple motors. There are three settings of fixed boost available:

- (2) **Fixed** = This mode provides the motor with a linear voltage characteristic from 0 Hz to *Motor Rated Frequency* (00.039), and then a constant voltage above rated frequency.
- (5) **Square** = This mode provides the motor with a square law voltage characteristic from 0 Hz to *Motor Rated Frequency* (00.039), and then a constant voltage above rated frequency. This mode is suitable for variable torque applications like fans and pumps where the load is proportional to the square of the speed of the motor shaft. This mode should not be used if a high starting torque is required.
- (6) Fixed Tapered = This mode provides the motor with a linear voltage characteristic with a tapered slip limit.

Safety Product Mechanical Running the Optimization Diagnostics **UL** Listina information information installation inetallation started parameters motor Card parameters

## Pr 00.041 {05.014} Control Mode (cont)

For mode 2 and 5, at low frequencies (from 0 Hz to ½ x Pr 00.039) a voltage boost is applied as defined by Pr 00.042 as shown below:

#### Pr 05.027 Enable Slip Compensation

When a motor, being controlled in open loop mode, has load applied a characteristic of the motor is that the output speed droops in proportion to the load applied as shown:

In order to prevent the speed droop shown above slip compensation should be enabled. To enable slip compensation Pr **05.027** must be set to a 100 % (this is the default setting), and the motor rated speed must be entered in Pr **00.007** (Pr **05.008**).

The motor rated speed parameter should be set to the synchronous speed of the motor minus the slip speed. This is normally displayed on the motor nameplate, i.e. for a typical 18.5 kW, 50 Hz, 4 pole motor, the motor rated speed would be approximately 1465 rpm. The synchronous speed for a 50 Hz, 4 pole motor is 1500 rpm, so therefore the slip speed would be 35 rpm. If the synchronous speed is entered in Pr 00.007, slip compensation will be disabled. If too small a value is entered in Pr 00.007, the motor will run faster than the demanded frequency. The synchronous speeds for 50 Hz motors with different numbers of poles are as follows:

2 pole = 3000 rpm, 4 pole = 1500 rpm, 6pole =1000 rpm, 8 pole = 750 rpm

#### 8.1.2 RFC-A mode

## Pr 00.006 {05.007} Motor Rated Current

Defines the maximum motor continuous current

The motor rated current parameter must be set to the maximum continuous current of the motor. The motor rated current is used in the following:

- Current limits (see section 8.3 Current limits on page 58, for more information).
- Motor thermal overload protection (see section 8.4 Motor thermal protection on page 58, for more information)
- Vector control algorithm

Pr 00.008 {05.009} Motor Rated Voltage

Pr 00.039 {05.006} Motor Rated Frequency

The Motor Rated Voltage (00.008) and the Motor Rated Frequency (00.039) are used to define the voltage to frequency characteristic applied to the motor. The motor rated frequency is also used in conjunction with the motor rated speed to calculate the rated slip for slip compensation (see Motor Rated Speed (00.007), later in this table).

Defines the voltage applied to the motor at rated frequency
Defines the frequency at which rated voltage is applied

Pr 00.007 {05.008} Motor Rated Speed

Pr 00.040 {05.011} Number of Motor Poles

Defines the full load rated speed of the motor and slip

Defines the number of motor poles

The motor rated speed and motor rated frequency are used to determine the full load slip of the motor which is used by the vector control algorithm. Incorrect setting of this parameter has the following effects:

- · Reduced efficiency of motor operation
- · Reduction of maximum torque available from the motor
- Reduced transient performance
- Inaccurate control of absolute torque in torque control modes

The nameplate value is normally the value for a hot motor; however, some adjustment may be required when the drive is commissioned if the nameplate value is inaccurate. A fixed value can be entered in this parameter.

When Pr **00.040** is set to 'Auto', the number of motor poles is automatically calculated from the *Motor Rated Frequency* (00.039), and the *Motor Rated Speed* (00.007).

Number of poles = 120 x (Motor Rated Frequency (00.039 / Motor Rated Speed (00.007) rounded to the nearest even number.

### Pr 00.009 {5.10} Motor Rated Power Factor

Defines the angle between the motor voltage and current

The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current. If the *Stator Inductance* (05.025) is set to zero then the power factor is used in conjunction with the *Motor Rated Current* (00.006) and other motor parameters to calculate the rated active and magnetising currents of the motor, which are used in the vector control algorithm. If the stator inductance has a non-zero value this parameter is not used by the drive, but is continuously written with a calculated value of power factor. The stator inductance can be measured by the drive by performing a rotating autotune (see *Autotune* (Pr **00.038**), later in this table).

Safety Product Runnina the NV Media Optimization Diagnostics **UL** Listina information information inetallation inetallation started parameters motor Card parameters

#### Pr 00.038 {05.012} Autotune

There are three autotune tests available in RFC-A mode, a stationary test, a rotating test and a mechanical load measurement test. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. An inertia measurement test should be performed separately to a stationary or rotating autotune.

#### NOTE

It is highly recommended that a rotating autotune is performed (Pr 00.038 set to 2).

- A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary autotune measures the *Stator Resistance* (05.017) and *Transient Inductance* (05.024) of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr **04.013** and Pr **04.014** are updated. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr **00.009**. To perform a Stationary autotune, set Pr **00.038** to 1, and provide the drive with both an enable signal (on terminal 11) and a run signal (on terminal 12 or 13).
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune, a rotating test is then performed which the motor is accelerated with currently selected ramps up to a frequency of *Motor Rated Frequency* (00.039) x 2/3, and the frequency is maintained at the level for up to 40 s. During the rotating autotune the *Stator Inductance* (05.025), and the motor saturation breakpoints (Pr 05.029, Pr 05.030, Pr 05.062 and Pr 05.063) are modified by the drive. The power factor is also modified for user information only, but is not used after this point as the stator inductance is used in the vector control algorithm instead. To perform a Rotating autotune, set Pr 00.038 to 2, and provide the drive with both an enable signal (on terminal 11) and a run signal (on terminal 12 or 13).
- The mechanical load test can measure the total inertia of the load and the motor. A series of progressively larger torque levels are applied to the motor (20 %, 40 % ... 100 % of rated torque) to accelerate the motor up to ¾ x Motor Rated Speed (00.007) to determine the inertia from the acceleration/deceleration time. The test attempts to reach the required speed within 5s, but if this fails, the next torque level is used. When 100 % torque is used, the test allows 60 s for the required speed to be reached, but if this is unsuccessful, an Autotune 1 trip is initiated. To reduce the time taken for the test, it is possible to define the level of torque to be used for the test by setting Mechanical Load Test Level (05.021) to a non-zero value. When the test level is defined, the test is only carried out at the defined test level and 60 s is allowed for the motor to reach the required speed. It should be noted that if the maximum speed allows for flux weakening then it may not be possible to achieve the required torque level to accelerate the motor fast enough. If this is the case, the maximum speed reference should be reduced.
  - 1. The motor must be stationary at the start of the test.
  - 2. The motor is accelerated in the required direction up to 3/4 of the maximum speed reference and then decelerated to zero speed.
  - 3. The test is repeated with progressively higher torque until the required speed is reached.

To perform a mechanical load measurement autotune, set Pr **00.038** to 3, and provide the drive with both an enable signal (on terminal 11) and a run signal (on terminal 12 or 13). Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the drive enable signal from terminal 11, setting the *Drive Enable* (06.015) to OFF (0) or disabling the drive via the control word (Pr **06.042** & Pr **06.043**).

### {04.013} / {04.014} Current Loop Gains

The current loop gains proportional (Kp) and integral (Ki) gains control the response of the current loop to a change in current (torque) demand. The default values give satisfactory operation with most motors. However, for optimal performance in dynamic applications it may be necessary to change the gains to improve the performance. The *Current Controller Kp Gain* (04.013) is the most critical value in controlling the performance. The values for the current loop gains can be calculated by performing a stationary or rotating autotune (see *Autotune Pr* **00.038** earlier in this table) the drive measures the *Stator Resistance* (05.017) and *Transient Inductance* (05.024) of the motor and calculates the current loop gains.

This will give a step response with minimum overshoot after a step change of current reference. The proportional gain can be increased by a factor of 1.5 giving a similar increase in bandwidth; however, this gives a step response with approximately 12.5 % overshoot. The equation for the integral gain gives a conservative value. In some applications where it is necessary for the reference frame used by the drive to dynamically follow the flux very closely (i.e. high speed Sensorless RFC-A induction motor applications) the integral gain may need to have a significantly higher value.

# Frequency Loop Gains (00.065 {03.010}, Pr 00.066 {03.011}

The frequency loop gains control the response of the frequency controller to a change in frequency demand. The frequency controller includes proportional (Kp) and integral (Ki) feed forward terms, and a differential (Kd) feedback term. The drive holds two sets of these gains and either set may be selected for use by the frequency controller with Pr 03.016. If Pr 03.016 = 0, gains Kp1, Ki1 and Kd1 (Pr 03.010 to Pr 03.012) are used, and if Pr 03.016 = 1, gains Kp2, Ki2 and Kd2 (Pr 03.013 to Pr 03.015) are used. Pr 03.016 may be changed when the drive is enabled or disabled.

Frequency Controller Proportional Gain (Kp), Pr 00.065 (03.010) and Pr 03.013

If the proportional gain has a value and the integral gain is set to zero the controller will only have a proportional term, and there must be a frequency error to produce a torque reference. Therefore as the motor load increases there will be a difference between the reference and actual frequencies. This effect, called regulation, depends on the level of the proportional gain, the higher the gain the smaller the frequency error for a given load. If the proportional gain is too high either the acoustic noise produced by numerical quantization becomes unacceptable, or the stability limit is reached.

Frequency Controller Integral Gain (Ki), Pr 00.066 (03.011) and Pr 03.014

The integral gain is provided to prevent frequency regulation. The error is accumulated over a period of time and used to produce the necessary torque demand without any frequency error. Increasing the integral gain reduces the time taken for the frequency to reach the correct level and increases the stiffness of the system, i.e. it reduces the positional displacement produced by applying a load torque to the motor. Unfortunately increasing the integral gain also reduces the system damping giving overshoot after a transient. For a given integral gain the damping can be improved by increasing the proportional gain. A compromise must be reached where the system response, stiffness and damping are all adequate for the application. For RFC-A Sensorless mode, it is unlikely that the integral gain can be increased much above 0.50.

Differential Gain (Kd), Pr 03.012 and Pr 03.015

The differential gain is provided in the feedback of the frequency controller to give additional damping. The differential term is implemented in a way that does not introduce excessive noise normally associated with this type of function. Increasing the differential term reduces the overshoot produced by under-damping, however, for most applications the proportional and integral gains alone are sufficient.

Gain Change Threshold, Pr 03.017

If the Frequency Controller Gain Select (03.016) = 2, gains Kp1, Ki1 and Kd1 (Pr **03.010** to Pr **03.012**) are used while the modulus of the frequency demand is less than the value held by Gain Change Threshold (03.017), else gains Kp2, Ki2 and Kd2 (Pr **03.013** to Pr **03.015**) will be used.

Tuning the frequency loop gains:

This involves the connecting of an oscilloscope to analog output 1 to monitor the frequency feedback.

Give the drive a step change in frequency reference and monitor the response of the drive on the oscilloscope.

The proportional gain (Kp) should be set up initially. The value should be increased up to the point where the frequency overshoots and then reduced slightly.

The integral gain (Ki) should then be increased up to the point where the frequency becomes unstable and then reduced slightly.

It may now be possible to increase the proportional gain to a higher value and the process should be repeated until the system response approaches the ideal response as shown.

The diagram shows the effect of incorrect P and I gain settings as well as the ideal response.

## 8.2 Maximum motor rated current

#### Size 1 to 4:

The maximum motor rated current is the *Maximum Heavy Duty Current Rating* (00.077).

The values for the Heavy Duty rating can be found in the *Power Installation Guide*.

#### Size 5 onwards:

The maximum motor rated current allowed by the drive is greater than the *Maximum Heavy Duty Current Rating* (00.077). The ratio between the Normal Duty rating and the *Maximum Heavy Duty Current Rating* (00.077) varies between drive sizes. The values for the Normal and Heavy Duty rating can be found in the *Power Installation Guide*. If the *Motor Rated Current* (00.006) is set above the *Maximum Heavy Duty Current Rating* (00.077), the current limits and the motor thermal protection scheme are modified (see section 8.3 *Current limits* on page 58 and section 8.4 *Motor thermal protection* below for further information).

### 8.3 Current limits

The default setting for the current limit parameters is:

- 165 % x motor rated torque producing current for open loop mode.
- 175 % x motor rated torque producing current for RFC-A mode.

There are three parameters which control the current limits:

- Motoring current limit: power flowing from the drive to the motor
- · Regen current limit: power flowing from the motor to the drive
- Symmetrical current limit: current limit for both motoring and regen operation

The lowest of either the motoring and regen current limit, or the symmetrical current limit applies.

The maximum setting of these parameters depends on the values of motor rated current, drive rated current and the power factor.

With size 5 upwards, increasing the motor rated current (Pr 00.006 / Pr 05.007) above the Heavy Duty rating (default value), will automatically reduce the current limits in Pr 04.005 to Pr 04.007. If the motor rated current is then set to or below the Heavy Duty rating, the current limits will be left at their reduced values.

The drive can be oversized to permit a higher current limit setting to provide higher accelerating torque as required up to a maximum of 1000 %.

## 8.4 Motor thermal protection

A time constant thermal model is provided to estimate the motor temperature as a percentage of its maximum allowed temperature.

The motor thermal protection is modelled using losses in the motor. The losses in the motor are calculated as a percentage value, so that under these conditions the *Motor Protection Accumulator* (04.019) would eventually reach 100 %.

Percentage losses = 100 % x [Load related losses]

Where:

Load related losses =  $[I / (K_1 \times I_{Rated})]^2$ 

Where:

I = Current Magnitude (04.001)

I<sub>Rated</sub> = Motor Rated Current (00.006)

If Motor Rated Current (00.006) ≤ Maximum Heavy Duty Current (00.077)

Figure 8-1 Motor thermal protection (Heavy Duty)

If Pr **04.025** is 0 the characteristic is for a motor which can operate at rated current over the whole speed range. Induction motors with this type of characteristic normally have forced cooling. If Pr **04.025** is 1 the characteristic is intended for motors where the cooling effect of motor fan reduces with reduced motor speed below 50 % of base speed/ frequency. The maximum value for K1 is 1.05, so that above the knee of the characteristics the motor can operate continuously up to 105 % current

Figure 8-2 Motor thermal protection (Normal Duty)

Both settings of Pr **04.025** are intended for motors where the cooling effect of the motor fan reduces with reduced motor speed, but with different speeds below which the cooling effect is reduced. If Pr **04.025** is 0 the characteristic is intended for motors where the cooling effect reduces with motor speed below 15 % of base speed/frequency. If Pr **04.025** is 1 the characteristic is intended for motors where the cooling effect reduces with motor speed below 50 % of base speed/frequency. The maximum value for K1 is 1.01, so that above the knee of the characteristics the motor can operate continuously up to 101 % current

When the estimated temperature in Pr **04.019** reaches 100 % the drive takes some action depending on the setting of Pr **04.016**. If Pr **04.016** is 0, the drive trips when Pr **04.019** reaches 100 %. If Pr **04.016** is 1, the current limit is reduced to  $(K - 0.05) \times 100 \%$  when Pr **04.019** reaches 100 %.

The current limit is set back to the user defined level when Pr **04.019** falls below 95 %. The thermal model temperature accumulator accumulates the temperature of the motor while the drive remains powered-up. By default, the accumulator is set to the power down value at power up. If the rated current defined by Pr **00.006** is altered, the accumulator is reset to zero.

The default setting of the thermal time constant (Pr 04.015) is 179 s which is equivalent to an overload of 150 % for 120 s from cold.

## 8.5 Switching frequency

The default switching frequency is 3 kHz, however this can be increased up to a maximum of 16 kHz by Pr **00.037**.

If switching frequency is increased from 3 kHz the following apply:

- Increased heat loss in the drive, which means that derating to the output current must be applied.
   See the derating tables for switching frequency and ambient temperature in the *Power Installation Guide*.
- Reduced heating of the motor due to improved output waveform quality.
- 3. Reduced acoustic noise generated by the motor.
- Increased sample rate on the speed and current controllers. A trade
  off must be made between motor heating, drive heating and the
  demands of the application with respect to the sample time required.

#### NOTE

Lowest switching frequency in RFC-A mode is 2 kHz.

Table 8-1 Sample rates for various control tasks at each switching frequency

Level	0.667, 3, 6, 12 2, 4, 8, 16 1 kHz kHz kHz			Open loop	RFC-A

Level 2	250 μs			Current limit and ramps	Speed controller and ramps
Level 3	1 ms			Voltage	controller
Level 4	4 ms				itical user erface
Background					critical user erface

#### 8.5.1 Field weakening (constant power) operation

The drive can be used to run an induction machine above synchronous speed into the constant power region. The speed continues to increase and the available shaft torque reduces. The characteristics below show the torque and output voltage characteristics as the speed is increased above the rated value.

Figure 8-3 Torque and rated voltage against speed

Care must be taken to ensure the torque available above base speed is sufficient for the application to run satisfactorily.

The saturation breakpoint parameters (Pr 05.029, Pr 05.030, Pr 05.062 and Pr 05.063) found during the autotune in RFC-A mode ensure the magnetizing current is reduced in the correct proportion for the specific motor. (In open loop mode the magnetizing current is not actively controlled).

### 8.5.2 Maximum frequency

In all operating modes the maximum output frequency is limited to 550 Hz.

### 8.5.3 Over-modulation (open-loop only)

The maximum output voltage level of the drive is normally limited to an equivalent of the drive input voltage minus voltage drops within the drive (the drive will also retain a few percent of the voltage in order to maintain current control). If the motor rated voltage is set at the same level as the supply voltage, some pulse deletion will occur as the drive output voltage approaches the rated voltage level. If Pr **05.020** (Over-modulation enable) is set to 1 the modulator will allow over modulation, so that as the output frequency increases beyond the rated frequency the voltage continues to increase above the rated voltage.

This can be used for example:

 To obtain high output frequencies with a low switching frequency which would not be possible with space vector modulation limited to unity modulation depth,

or

 In order to maintain a higher output voltage with a low supply voltage

The disadvantage is that the machine current will be distorted as the modulation depth increases above unity, and will contain a significant amount of low order odd harmonics of the fundamental output frequency. The additional low order harmonics cause increased losses and heating in the motor.

## 8.5.4 Switching frequency

With a default switching frequency of 3 kHz, the maximum output frequency should be limited to 250 Hz. Ideally, a minimum ratio of 12:1 should be maintained between the switching frequency and the output frequency. This ensures the number of switchings per cycle is sufficient to ensure the output waveform quality is maintained at a minimum level.

## 8.6 CT Modbus RTU specification

This section describes the adaptation of the MODBUS RTU protocol offered on Control Techniques' products. The portable software class which implements this protocol is also defined.

MODBUS RTU is a master slave system with half-duplex message exchange. The Control Techniques (CT) implementation supports the core function codes to read and write registers. A scheme to map between MODBUS registers and CT parameters is defined. The CT implementation also defines a 32 bit extension to the standard 16 bit register data format.

#### 8.6.1 MODBUS RTU

#### **Physical layer**

Attribute	Description
Normal physical layer for multi-drop operation	EIA485 2 wire
Bit stream	Standard UART asynchronous symbols with Non Return to Zero (NRZ)
Symbol	Each symbol consists of:- 1 start bit 8 data bits (transmitted least significant bit first) 2 stop bits*
Baud rates	600, 1200, 2400, 4800, 9600, 19200, 38400, 57600, 76800, 115200

<sup>\*</sup> The drive will accept a packet with 1 or 2 stop bits but will always transmit 2 stop bits

#### RTU framing

The frame has the following basic format

The frame is terminated with a minimum silent period of 3.5 character times (for example, at 19200 baud the minimum silent period is 2 ms). Nodes use the terminating silence period to detect the end of frame and begin frame processing. All frames must therefore be transmitted as a continuous stream without any gaps greater or equal to the silence period. If an erroneous gap is inserted then receiving nodes may start frame processing early in which case the CRC will fail and the frame will be discarded.

MODBUS RTU is a master slave system. All master requests, except broadcast requests, will lead to a response from an individual slave. The slave will respond (i.e. start transmitting the response) within the quoted maximum slave response time (this time is quoted in the data sheet for all Control Techniques products). The minimum slave response time is also quoted but will never be less that the minimum silent period defined by 3.5 character times

If the master request was a broadcast request then the master may transmit a new request once the maximum slave response time has expired.

The master must implement a message time out to handle transmission errors. This time out period must be set to the maximum slave response time + transmission time for the response.

## 8.6.2 Slave address

The first byte of the frame is the slave node address. Valid slave node addresses are 1 through 247 decimal. In the master request this byte indicates the target slave node; in the slave response this byte indicates the address of the slave sending the response.

#### Global addressing

Address zero addresses all slave nodes on the network. Slave nodes suppress the response messages for broadcast requests.

information	information	installation	installation	started	parameters	motor	- p	Card	parameters	3	

#### 8.6.3 MODBUS registers

The MODBUS register address range is 16 bit (65536 registers) which at the protocol level is represented by indexes 0 through 65535.

### **PLC** registers

Modicon PLCs typically define 4 register 'files' each containing 65536 registers. Traditionally, the registers are referenced 1 through 65536 rather than 0 through 65535. The register address is therefore decremented on the master device before passing to the protocol.

File type	Description
1	Read only bits ("coil")
2	Read / write bits ("coil")
3	Read only 16bit register
4	Read / write 16bit register

The register file type code is NOT transmitted by MODBUS and all register files can be considered to map onto a single register address space. However, specific function codes are defined in MODBUS to support access to the "coil" registers.

All standard CT drive parameters are mapped to register file '4' and the coil function codes are not required.

#### CT parameter mapping

The Modbus register address is 16 bits in size, of which the upper two bits are used for data type selection leaving 14 bits to represent the parameter address, taking into account the slave increments the address value by 1, this results in a theoretical maximum parameter address of 163.84 (limited to 162.99 in software) when the default standard addressing mode (see *Serial Mode* (11.024)) is used.

To access a parameter number above 99 in any drive menu then the modified addressing mode must be used (see *Serial Mode* (11.024)), this will allow access to parameter numbers up to 255 but also limit the maximum menu number to 63.

The Modbus slave device increments the register address by 1 before processing the command, this effectively prevents access to parameter Pr 00.000 in the drive or option module.

The table below shows how the start register address is calculated for both addressing modes.

Parameter	Addressing mode	Protocol register				
0 mm nnn	Standard	mm x 100 + ppp - 1				
0.mm.ppp	Modified		mm x 256	+ ppp - 1		
	1	Examples				
		16-b	it	<b>32</b> -b	oit	
		Decimal	Hex (0x)	Decimal	Hex (0x)	
0.04.004	Standard	120	00 78	16504	40 78	
0.01.021	Modified	276	01 14	16660	41 14	
0.01.000	Standard	99	00 63	16483	40 63	
	Modified	255	00 FF	16639	40 FF	
0.03.161	Standard	N/A	N/A	N/A	N/A	
	Modified	928	03 A0	17312	43 A0	

## Data types

The MODBUS protocol specification defines registers as 16 bit signed integers. All CT devices support this data size.

Refer to the section 8.6.7 Extended data types on page 63 for detail on accessing 32 bit register data.

## 8.6.4 Data consistency

All CT devices support a minimum data consistency of one parameter (16 bit or 32 bit data). Some devices support consistency for a complete multiple register transaction.

## 8.6.5 Data encoding

MODBUS RTU uses a 'big-endian' representation for addresses and data items (except the CRC, which is 'little-endian'). This means that when a numerical quantity larger than a single byte is transmitted, the MOST significant byte is sent first. So for example

16 - bits 0x1234 would be 0x12 0x34 32 - bits 0x12345678 would be 0x12 0x34 0x56 0x78

## 8.6.6 Function codes

The function code determines the context and format of the message data. Bit 7 of the function code is used in the slave response to indicate an exception.

The following function codes are supported:

Code	de Description					
3	Read multiple 16 bit registers					
6	Write single register					
16	Write multiple 16 bit registers					
23	Read and write multiple 16 bit registers					

## FC03 Read multiple

Read a contiguous array of registers. The slave imposes an upper limit on the number of registers, which can be read. If this is exceeded the slave will issue an exception code 2.

## 8.6.7 Extended data types

Standard MODBUS registers are 16bit and the standard mapping maps a single #X.Y parameter to a single MODBUS register. To support 32 bit data types (integer and float) the MODBUS multiple read and write services are used to transfer a contiguous array of 16bit registers.

Slave devices typically contain a mixed set of 16 bit and 32 bit registers. To permit the master to select the desired 16 bit or 32 bit access the top two bits of the register address are used to indicate the selected data type.

#### NOTE

The selection is applied for the whole block access.

bit 15 TYP1	bit 14 TYP0	bits 0 - 13
Type select		Parameter address X x 100+Y-1

The 2bit type field selects the data type according to the table below:

Type field bits 15-14	Selected data type	Comments
00	INT16	backward compatible
01	INT32	
10	Float32	IEEE754 standard Not supported on all slaves
11	Reserved	

If a 32 bit data type is selected then the slave uses two consecutive 16 bit MODBUS registers (in 'big endian'). The master must also set the correct 'number of 16 bit registers'.

Example, read Pr **20.021** through Pr **20.024** as 32 bit parameters using FC03 from node 8:

Table 8-10 Master request

Byte	Value	Description
0	0x08	Slave destination node address
1	0x03	FC03 multiple read
2	0x47	Start register address Pr 20.021
3	0xE4	(16384 + 2021 - 1) = 18404 = 0x47E4
4	0x00	Number of 16bit registers to read
5	0x08	Pr <b>20.021</b> through Pr <b>20.024</b> is 4x32 bit registers = 8x16 bit registers
6	CRC LSB	
7	CRC MSB	

Table 8-11 Slave response

Byte	Value	Description

2	0x10	Length of data (bytes) = 4x32 bit registers = 16 bytes
3-6		Pr <b>20.021</b> data
7-10		Pr <b>20.022</b> data
11-14		Pr <b>20.023</b> data
15-18		Pr <b>20.024</b> data
19	CRC LSB	
20	CRC MSB	

Reads when actual parameter type is different from selected The slave will send the least significant word of a 32 bit parameter if that parameter is read as part of a 16 bit access. The slave will sign extend the least significant word if a 16 bit parameter is accessed as a 32 bit parameter. The number of 16 bit registers must be even during a 32 bit access.

Example, If Pr **01.028** is a 32 bit parameter with a value of 0x12345678, Pr **01.029** is a signed 16 bit parameter with a value of 0xABCD, and Pr **01.030** is a signed 16 bit parameter with a value of 0x0123.

Read	Start register address	Number of 16 bit registers	Response	Comments	
Pr <b>01.028</b>	127	1	0x5678	Standard 16 bit access to a 32 bit register will return low 16 bit word of truncated data	
Pr <b>01.028</b>	16511*	2	0x12345678	Full 32 bit access	
Pr <b>01.028</b>	28 16511* 1		Exception 2	Number of words must be even for 32 bit access	
Pr <b>01.029</b>	Pr <b>01.029</b> 128		0xABCD	Standard 16 bit access to a 32 bit register will return low 16 bit word of data	
Pr <b>01.029</b>	16512*	2	0xFFFFABCD	32 bit access to a 16 bit register will return 32 bit sign extended data	
Pr <b>01.030</b>	16513*	2	0x00000123	32 bit access to a 16 bit register will return 32 bit sign extended data	
Pr 01.028 to Pr 01.029	127	2	0x5678, 0xABCD	Standard 16 bit access to a 32 bit register will return low 16 bit word of truncated data	
Pr 01.028 to Pr 01.029	16511*	4	0x12345678, 0xFFFFABCD	Full 32 bit access	

<sup>\*</sup> Bit 14 is set to allow 32 bit access.

# Writes when actual parameter type is different from selected

The slave will allow writing a 32 bit value to a 16 bit parameter as long as the 32 bit value is within the normal range of the 16 bit parameter.

The slave will allow a 16 bit write to a 32 bit parameter. The slave will sign extend the written value, therefore the effective range of this type of write will be -32768 to +32767.

Examples, if Pr 01.028 has a range of  $\pm 100000$ , and Pr 01.029 has a range of  $\pm 10000$ .

<sup>\*</sup> Bit 14 is set to allow 32 bit access

## 8.6.8 Exceptions

The slave will respond with an exception response if an error is detected in the master request. If a message is corrupted and the frame is not received or the CRC fails then the slave will not issue an exception. In this case the master device will time out. If a write multiple (FC16 or FC23) request exceeds the slave maximum buffer size then the slave will discard the message. No exception will be transmitted in this case and the master will time out.

### **Exception message format**

The slave exception message has the following format.

Byte	Description					
0	Slave source node address					
1	Original function code with bit 7 set					
2	Exception code					
3	CRC LSB					
4	CRC MSB					

#### **Exception codes**

The following exception codes are supported.

Code	Description
1	Function code not supported
2	Register address out of range, or request to read too many registers

#### Parameter over range during block write FC16

The slave processes the write block in the order the data is received. If a write fails due to an out of range value then the write block is terminated. However, the slave does not raise an exception response, rather the error condition is signalled to the master by the number of successful writes field in the response.

## Parameter over range during block read/write FC23

There will be no indication that there has been a value out of range during a FC23 access.

#### 8.6.9 CRC

The CRC is a 16bit cyclic redundancy check using the standard CRC-16 polynomial x16 + x15 + x2 + 1. The 16 bit CRC is appended to the message and transmitted LSB first.

The CRC is calculated on ALL the bytes in the frame.

## 8.6.10 Device compatibility parameters

All devices have the following compatibility parameters defined:

Parameter	Description
Device ID	Unique device identification code
Minimum slave response time	The minimum delay between the end of a message from the master and the time at which the master is ready to receive a response from the slave. Refer to para 11-26
Maximum slave response time	When global addressing, the master must wait for this time before issuing a new message. In a network of devices, the slowest time must be used
Maximum baud rate	
32 bit float data type supported	If this data type is not supported then an over range error will be raised if this data type is used
Maximum buffer size	Determines the maximum block size.

Safety Product Mechanical Electrical Getting Basic Running the information installation installation started parameters motor Optimization Optimizat

## 9 NV Media Card

### 9.1 Introduction

The Non-Volatile Media Card feature enables simple configuration of parameters, parameter back-up and drive cloning using an SD card.

The SD card can be used for:

- · Parameter copying between drives
- · Saving drive parameter sets

The NV Media Card (SD card) is located in the Al-Backup adaptor.

The card is not hot swappable, but the Al-Backup adaptor is "hot swapped" only when the five unit LEDs on the display are not flashing. The unit LEDs flash during the data transfer.

Figure 9-1 Installation of the SD card

Installing the SD card

#### NOTE

A flat bladed screwdriver or similar tool is required in order to insert / remove the SD card fully into the Al-Backup adaptor.

Before inserting / removing the SD card into / from the Al-Backup adaptor, the Al-Backup adaptor must be removed from the drive.

## 9.2 SD card support

An SD memory card can be inserted in the Al-Backup Adaptor in order to transfer data to the drive, however the following limitations should be noted:

If a parameter from the source drive does not exist in the target drive then no data is transferred for that parameter.

If the data for the parameter in the target drive is out of range then the data is limited to the range of the target parameter.

If the target drive has a different rating to the source drive then the normal rules for this type of transfer apply as described later.

No checking is possible to determine if the source and target product types are the same, and so no warning is given if they are different.

If an SD card is used then the drive will recognise the following file types through the drive parameter interface.

File Type	Description
Parameter file	A file that contains all clonable user save parameters from the drive menus (1 to 30) in difference from default format
Macro file	The same as a parameter file, but defaults are not loaded before the data is transferred from the card

These files can be created on a card by the drive and then transferred to any other drive including derivatives. If the Drive Derivative (11.028) is different between the source and target drives then the data is transferred but a {C.Pr} trip is initiated.

It is possible for other data to be stored on the card, but this should not be stored in the <MCDF> folder and it will not be visible via the drive parameter interface.

### 9.2.1 Changing the drive mode

If the source drive mode is different from the target drive mode then the mode will be changed to the source drive mode before the parameters are transferred. If the required drive mode is outside the allowed range for the target then a {C.typ} trip is initiated and no data is transferred.

### 9.2.2 Different voltage ratings

If the voltage rating of the source and target drives is different then all parameters except those that are rating dependent (i.e. attribute RA=1) are transferred to the target drive. The rating dependent parameters are left at their default values. After the parameters have been transferred and saved to non-volatile memory a {C.rtg} trip is given as a warning. The table below gives a list of the rating dependent parameters.

Parameters
Standard Ramp Voltage (02.008)
Motoring Current Limit (04.005)
M2 Motoring Current Limit (21.027)
Regenerating Current Limit (04.006)
M2 Regenerating Current Limit (21.028)
Symmetrical Current Limit (04.007)
M2 Symmetrical Current Limit (21.029)
User Current Maximum Scaling (04.024)
Motor Rated Current (05.007)
M2 Motor Rated Current (21.007)
Motor Rated Voltage (05.009)
M2 Motor Rated Voltage (21.009)
Motor Rated Power Factor (05.010)
M2 Motor Rated Power Factor (21.010)
Stator Resistance (05.017)
M2 Stator Resistance (21.012)
Maximum Switching Frequency (05.018)
Transient Inductance /Ld (05.024)
M2 Transient Inductance /Ld (21.014)
Stator Inductance (05.025)
M2 Stator Inductance (21.024)
Injection Braking Level (06.006)
Supply Loss Detection Level (06.048)

### 9.2.3 Different option modules installed

If the option module ID code (15.001) is different for any option module installed to the source drive compared to the destination drive, then the parameters for the set-up for that option module are not transferred, but and are instead set to their default values. After the parameters have been transferred and saved to non-volatile memory, a {C.OPt} trip is given as a warning.

Safety Product Mechanical Electrical Getting Basic Formation information installation installati

### 9.2.4 Different current ratings

If any of the current rating parameters (Maximum Heavy Duty Rating (00.077), Maximum Rated Current (11.060) or Full Scale Current Kc (11.061)) are different between the source and target then all parameters are still written to the target drive, but some may be limited by their allowed range. To give similar performance in the target compared to the source drive the frequency and current controller gains are modified as shown below. Note that this does not apply if the file identification number is larger than 500.

Gains	Multiplier
Frequency Controller Proportional Gain Kp1 (03.010)	[Source Full Scale Current Kc (11.061)] /
Frequency Controller Integral Gain Ki1 (03.011)	[Target Full Scale Current Kc (11.061)]
Frequency Controller Proportional Gain Kp2 (03.013)	
Frequency Controller Integral Gain Ki2 (03.014)	
M2 Frequency Controller Proportional Gain Kp (21.017)	
M2 Frequency Controller Integral Gain Ki (21.018)	
Current Controller Kp Gain (04.013)	[Source Full Scale Current Kc
Current Controller Ki Gain (04.014)	(11.061)] /
M2 Current Controller Kp Gain (21.022)	[Target Full Scale Current Kc (11.061)]
M2 Current Controller Ki Gain (21.023)	

#### 9.2.5 Different variable maximums

It should be noted that if ratings of the source and target drives are different, it is possible that some parameters with variable maximums may be limited and not have the same values as in the source drive.

#### 9.2.6 Macro files

Macro files are created in the same way as parameter files except that *NV Media Card Create Special File* (11.072) must be set to 1 before the file is created on the NV media card. *NV Media Card Create Special File* (11.072) is set to zero after the file has been created or the transfer fails. When a macro file is transferred to a drive the drive mode is not changed even if the actual mode is different to that in the file and defaults are not loaded before the parameters are copied from the file to the drive.

The table below gives a summary of the values used in Pr mm.000 for NV media card operations. The yyy represents the file identification number.

Table 9-1 Functions in Pr mm.000

Value	Action
2001	Transfer the drive parameters to parameter file 001 and sets the block as bootable.  This will include the parameters from any attached option module.
4ууу	Transfer the drive parameters to parameter file yyy. This will include the parameters from any attached option module.
6ууу	Load the drive parameters from parameter file yyy
7ууу	Erase file yyy.
8ууу	Compare the data in the drive with the file yyy. The data in the drive is compared to the data in the file yyy. If the files are the same then Pr <b>mm.000</b> is simply reset to 0 when the compare is complete. If the files are different a {Card Compare} trip is initiated. All other NV media card trips also apply.
9555	Clear the warning suppression flag.
9666	Set the warning suppression flag.
9777	Clear the read-only flag.
9888	Set the read-only flag.

# 9.2.7 Writing to the NV Media Card

4yyy - Writes defaults differences to the NV Media Card

The data block only contains the parameter differences from the last time default settings were loaded.

All parameters except those with the NC (Not copied) coding bit set are transferred to the NV Media Card. In addition to these parameters all menu 20 parameters (except Pr 20.000), can be transferred to the NV Media Card.

# Writing a parameter set to the NV Media Card (Pr 00.030 = Prog (2))

Setting Pr **00.030** to Prog (2) and resetting the drive will save the parameters to the NV Media Card, i.e. this is equivalent to writing 4001 to Pr **mm.000**. All NV Media Card trips apply. If the data block already exists it is automatically overwritten. When the action is complete this parameter is automatically reset to NonE (0).

# 9.2.8 Reading from the NV Media Card 6yyy - Reading from NV Media Card

When the data is transferred back to the drive, using 6yyy in Pr mm.000, it is transferred to the drive RAM and the EEPROM. A parameter save is not required to retain the data after-power down. Set up data for any option module installed stored on the card are transferred to the drive. If the option module installed is different between source and destination drives, the menu for the option module slot where the option module category is different is not updated from the card and will contain its default values after the copying action. The drive will produce a 'C.OPt' trip if the option module installed to the source and the destination drives are different. If the data is being transferred to the drive with different voltage or current rating a 'C.rtg' trip will occur.

The following drive rating dependant parameters (RA coding bit set) will not be transferred to the destination drive by a NV Media Card when the

Safety Product information installation started parameters Product information installation inst

voltage rating of the destination drive is different from the source drive and the file is a parameter file.

However, drive rating dependent parameters will be transferred if only the current rating is different. If drive rating dependant parameters are not transferred to the destination drive they will contain their default values.

Pr 02.008 Standard Ramp Voltage

 $\mbox{Pr}$   $\bf 04.005$  to  $\mbox{Pr}$   $\bf 04.007$  and  $\mbox{Pr}$   $\bf 21.027$  to  $\mbox{Pr}$   $\bf 21.029$  Motoring Current Limits

Pr 04.024, User Current Maximum Scaling

Pr 05.017, Pr 21.012 Stator Resistance

Pr 05.018 Maximum Switching Frequency

Pr 05.024, Pr 21.014 Transient Inductance

Pr 05.025, Pr 21.024 Stator Inductance

Pr 06.006 Injection Braking Level

Pr 06.048 Supply Loss Detection Level

Pr 06.073 Braking IGBT Lower Threshold

Pr 06.074 Braking IGBT Upper Threshold

Pr 06.075 Low Voltage Braking IGBT Threshold

# Reading a parameter set from the NV Media Card (Pr 00.030 = rEAd (1))

Setting Pr **00.030** to rEAd (1) and resetting the drive will transfer the parameters from the card into the drive parameter set and the drive EEPROM, i.e. this is equivalent to writing 6001 to Pr **mm.000**.

All NV Media Card trips apply. Once the parameters are successfully copied this parameter is automatically reset to NonE (0). Parameters are saved to the drive EEPROM after this action is complete.

# 9.2.9 Auto saving parameter changes (Pr 00.030 = Auto (3))

This setting causes the drive to automatically save any changes made to menu 0 parameters on the drive to the NV Media Card. The latest menu 0 parameter set in the drive is therefore always backed up on the NV Media Card. Changing Pr **00.030** to Auto (3) and resetting the drive will immediately save the complete parameter set from the drive to the card, i.e. all parameters except parameters with the NC coding bit set. Once the whole parameter set is stored only the individual modified menu 0 parameter setting is updated.

Advanced parameter changes are only saved to the NV Media Card when Pr **mm.000** is set to 'SAVE' or a 1001 and the drive reset.

All NV Media Card trips apply. If the data block already contains information it is automatically overwritten. If the card is removed when Pr **00.030** is set to 3, Pr **00.030** is then

When a new NV Media Card is installed Pr **00.030** must be set back to Auto (3) by the user and the drive reset so the complete parameter set is rewritten to the new NV Media Card if auto mode is still required. When Pr **00.030** is set to Auto (3) and the parameters in the drive are

saved, the NV Media Card is also updated, and therefore the NV Media Card becomes a copy of the drives stored configuration.

At power up, if Pr **00.030** is set to Auto (3), the drive will save the complete parameter set to the NV Media Card. The 5 unit LEDs will flash during this operation. This is done to ensure that if a user puts a new NV Media Card in during power down the new NV Media Card will have the correct data.

#### NOTE

When Pr **00.030** is set to Auto (3) the setting of Pr **00.030** itself is saved to the drive EEPROM but not the NV Media Card.

# 9.2.10 Booting up from the NV Media Card on every power up (Pr 00.030 = boot (4))

When Pr **00.030** is set to boot (4) the drive operates the same as Auto mode except when the drive is powered-up. The parameters on the NV Media Card will be automatically transferred to the drive at power up if the following are true:

- · A card is inserted in the drive
- · Parameter data block 1 exists on the card
- The data in block 1 is type 1 to 4 (as defined in Pr 11.038)
- Pr **00.030** on the card set to boot (4)

The 5 unit LEDs will flash during this operation. If the

drive mode is different from that on the card, the drive gives a 'C.tyP' trip and the data is not transferred.

If 'boot' mode is stored on the copying NV Media Card this makes the copying NV Media Card the master device. This provides a very fast and efficient way of re-programming a number of drives.

'boot' mode is saved to the card, but when the card is read, the value of Pr **00.030** is not transferred to the drive.

# 9.2.11 Booting up from the NV Media Card on every power up (Pr mm.000 = 2001)

It is possible to create a bootable parameter data block by setting Pr mm.000 to 2001 and initiating a drive reset. This data block is created in one operation and is not updated when further parameter changes are made

Setting Pr mm.000 to 2001 will overwrite the data block 1 on the card if it already exists.

# 9.2.12 8yyy - Comparing the drive full parameter set with the NV Media Card values

Setting 8yyy in Pr mm.000, will compare the NV Media Card file with the data in the drive. If the compare is successful Pr mm.000 is simply set to 0. If the compare fails a 'C.cPr' trip is initiated.

# 9.2.13 7yyy - Erasing data from the NV Media Card values

Data can be erased from the NV Media Card either one block at a time or all blocks in one go.

Setting 7yyy in Pr mm.000 will erase NV Media Card data block yyy

# 9.2.14 9666 / 9555 - Setting and clearing the NV Media Card warning suppression flag

If the option module installed to the source and destination drive are different the drive will produce a 'C.OPt' trip.

automatically set to NonE (0).

Safety	Product	Mechanical	Electrical	Getting	Basic	Running the	Optimization	NV Media	Advanced	Diagnostics	UL Listing
information	information	installation	installation	started	parameters	motor	Optimization	Card	parameters	Diagnostics	OL LISTING

If the data is being transferred to a drive of a different voltage or current rating a 'C.rtg' trip will occur. It is possible to suppress these trips by setting the warning suppression flag. If this flag is set the drive will not trip if the option module or drive ratings are different between the source and destination drives. The option module or rating dependent parameters will not be transferred.

- Setting 9666 in Pr mm.000 will set the warning suppression flag
- Setting 9555 in Pr mm.000 will clear the warning suppression flag

# 9.2.15 9888 / 9777 - Setting and clearing the NV Media Card read only flag

The NV Media Card may be protected from writing or erasing by setting the read only flag. If an attempt is made to write or erase a data block when the read only flag is set, a 'C.rdo' trip is initiated. When the read only flag is set only codes 6yyy or 9777 are effective.

- · Setting 9888 in Pr mm.000 will set the read only flag
- · Setting 9777 in Pr mm.000 will clear the read only flag

## 9.3 NV Media Card parameters

Table 9-2 Key to parameter table coding

			-
RW	Read / Write	ND	No default value

## 9.4 NV Media Card trips

After an attempt to read, write or erase data from a NV Media Card a trip is initiated if there has been a problem with the command.

See Chapter 11 *Diagnostics* on page 127 for more information on NV Media Card trips.

## 9.5 Data block header information

Each data block stored on a NV Media Card has header information detailing the following:

- NV Media Card File Number (11.037)
- NV Media Card File Type (11.038)
- NV Media Card File Version (11.039)

The header information for each data block which has been used can be viewed in Pr 11.038 to Pr 11.039 by increasing or decreasing the data block number set in Pr 11.037. If there is no data on the card Pr 11.037 can only have a value of 0.

Safety Product Mechanical Electrical Getting Information Installation 
## 10 Advanced parameters

This is a quick reference to all parameters in the drive showing units, ranges limits etc, with block diagrams to illustrate their function. Full descriptions of the parameters can be found in the Parameter Reference Guide.

These advanced parameters are listed for reference purposes only. The lists in this chapter do not include sufficient information for adjusting these parameters. Incorrect adjustment can affect the safety of the system, and damage the drive and or external equipment. Before attempting to adjust any of these parameters, refer to the *Parameter reference guide*.

Table 10-1 Menu descriptions

Menu	Description

<sup>\*</sup> Only displayed when the option module is installed.

#### Operation mode abbreviations:

Open-loop: Sensorless control for induction motors

RFC-A: Asynchronous Rotor Flux Control for induction motors

#### Default abbreviations:

Standard default value (50 Hz AC supply frequency)

USA default value (60 Hz AC supply frequency)

#### NOTE

Parameter numbers shown in brackets {...} are the equivalent Menu 0 parameters. Some Menu 0 parameters appear twice since their function depends on the operating mode.

In some cases, the function or range of a parameter is affected by the setting of another parameter. The information in the lists relates to the default condition of any parameters affected in this way.

Table 10-2 Key to parameter table coding

Coding	Attribute
RW	Read/Write: can be written by the user
RO	Read only: can only be read by the user
Bit	1 bit parameter. 'On' or 'Off' on the display
Num	Number: can be uni-polar or bi-polar
Txt	Text: the parameter uses text strings instead of numbers.
Bin	Binary parameter
IP	IP Address parameter
Mac	Mac Address parameter
Date	Date parameter
Time	Time parameter
Chr	Character parameter
FI	Filtered: some parameters which can have rapidly changing values are filtered when displayed on the drive keypad for easy viewing.
DE	Destination: This parameter selects the destination of an input or logic function.
RA	Rating dependent: this parameter is likely to have different values and ranges with drives of different voltage and current ratings. Parameters with this attribute will be transferred to the destination drive by non-volatile storage media when the rating of the destination drive is different from the source drive and the file is a parameter file. However, the values will be transferred if only the current rating is different and the file is a difference from default type file.
ND	No default: The parameter is not modified when defaults are loaded
NC	Not copied: not transferred to or from non-volatile media during copying.
PT	Protected: cannot be used as a destination.
US	User save: parameter saved in drive EEPROM when the user initiates a parameter save.
PS	Power-down save: parameter automatically saved in drive EEPROM when the under volts (UV) state occurs.

## 10.1 Parameter ranges and Variable minimum/maximums:

Some parameters in the drive have a variable range with a variable minimum and a variable maximum values which is dependent on one of the following:

- The settings of other parameters
- · The drive rating
- · The drive mode
- Combination of any of the above

The tables below give the definition of variable minimum/maximum and the maximum range of these.

VM_AC_\	<b>/OLTAGE</b> Range applied to parameters showing AC voltage
Units	V
Range of [MIN]	0
Range of [MAX]	0 to 930
Definition	VM_AC_VOLTAGE[MAX] is drive voltage rating dependent. See Table 10-4
Delilition	VM_AC_VOLTAGE[MIN] = 0

VM_AC_VOL	Range applied to the AC voltage set-up parameters	
Units	V	
Range of [MIN]	0	
Range of [MAX]	0 to 765	
Definition	VM_AC_VOLTAGE_SET[MAX] is drive voltage rating dependent. See Table 10-4	
Delililition	VM_AC_VOLTAGE_SET[MIN] = 0	

Safety	Product	Mechanical	Electrical	Getting	Basic	Running the	Optimization	NV Media Card	Advanced	Diagnostics	UL Listina
information	information	installation	installation	started	parameters	motor	Optimization	IV Wicaia Cara	parameters	Diagnostics	OL LIGHING

VM_A	ACCEL_RATE Maximum applied to the ramp rate parameters
Units	s / 100 Hz, s/1000 Hz, s/Max Frequency
Range of [MIN]	Open-loop: 0.0 RFC-A: 0.0
Range of [MAX]	Open-loop: 0.0 to 3200.0 RFC-A: 0.0 to 3200.0
	A maximum needs to be applied to the ramp rate parameters because the units are a time for a change of speed from zero to a defined level or to maximum speed. If the change of speed is to the maximum speed then changing the maximum speed changes the actual ramp rate for a given ramp rate parameter value. The variable maximum calculation ensures that longest ramp rate (parameter at its maximum value) is not slower than the rate with the defined level, i.e. 3200.0 s/100 Hz.
Definition	The maximum frequency is taken from <i>Maximum Reference Clamp</i> (01.006) if <i>Select Motor 2 Parameters</i> (11.045) = 0, or <i>M2 Maximum Reference Clamp</i> (21.001) if <i>Select Motor 2 Parameters</i> (11.045) = 1.
	VM_ACCEL_RATE[MIN] = 0.0
	If Ramp Rate Units (02.039) = 0:
	VM_ACCEL_RATE[MAX] = 3200.0
	Otherwise:
	VM_ACCEL_RATE[MAX] = 3200.0 x Maximum frequency / 100.00

	VM_DC_VOLTAGE	Range applied to DC voltage reference parameters
Units	V	
Range of [MIN]	0	
Range of [MAX]	0 to 1190	
Definition		SE[MAX] is the full scale DC link voltage feedback (over voltage trip level) for the drive. This level is g dependent. See Table 10-4 SE[MIN] = 0

VM_DC_VO	LTAGE_SET	Range applied to DC voltage reference parameters	
Units	V		
Range of [MIN]	0		
Range of [MAX]	0 to 1150		
VM_DC_VOLTAGE_SET[MAX] is drive voltage rating dependent. See Table 10-4  VM_DC_VOLTAGE_SET[MIN] = 0			

VM_DRIV	E_CURRENT	Range applied to parameters showing current in A
Units	Α	
Range of [MIN]	-9999.99 to 0.00	
Range of [MAX]	0.00 to 9999.99	
Definition	Scale Current Kc (11.061	MAX] is equivalent to the full scale (over current trip level) for the drive and is given by <i>Full</i> ).  MIN] = - VM_DRIVE_CURRENT[MAX]

	VM_FREQ	Range applied to parameters showing frequency
Units	Hz	
Range of [MIN]	-1100.00	
Range of [MAX]	1100.00	
Definition	the range is set to tw VM_FREQ[MIN] = 2	m/maximum defines the range of speed monitoring parameters. To allow headroom for overshoot ice the range of the speed references.  x VM_SPEED_FREQ_REF[MIN]  x VM_SPEED_FREQ_REF[MAX]

Safety	Product	Mechanical	Electrical	Getting	Basic	Running the	Ontimization	NV Media Card	Advanced	Diagnostics	UL Listina
information	information	installation	installation	started	parameters	motor	Optimization	NV Media Card	parameters	Diagnostics	UL Listing

VM_MAX_SWI	TCHING_FREQUENCY Range applied to the maximum switching frequency parameters
Units	User units
Range of [MIN]	Open-loop: 0 (0.667 kHz) RFC-A: 2 (2 kHz)
Range of [MAX]	Open-loop: 8 (16kHz) RFC-A: 8 (16kHz)
Definition	VM_SWITCHING_FREQUENCY[MAX] = Power stage dependent VM_SWITCHING_FREQUENCY[MIN] = 0 This variable maximum is used by the <i>Minimum Switching Frequency</i> (05.038) to define the minimum frequency limit used if the inverter thermal model is actively reducing the switching frequency due to temperature.  Note that parameter <i>Maximum Switching Frequency</i> (05.018) takes priority over parameter <i>Minimum Switching Frequency</i> (05.038) so is not limited by parameter <i>Minimum Switching Frequency</i> (05.038). The actual minimum switching frequency limit used is the lower of <i>Maximum Switching Frequency</i> (05.018) and <i>Minimum Switching Frequency</i> (05.038).

Safety	Product	Mechanical	Electrical	Getting	Basic	Running the	Optimization	NV Media Card	Advanced	Diagnostics	UL Listing
information	information	installation	installation	started	parameters	motor	Optimization	IV Wicala Cara	parameters	Diagnostics	OL LISTING

VM_MOTOR2_0	CURRENT_LIMIT	Range applied to current limit parameters (motor 2)
Units	%	
Range of [MIN]	0.0	
Range of [MAX]	0.0 to 1000.0	
Definition	VM_MOTOR2_CURRENT Refer to VM_MOTOR1_C	_LIMIT[MAX] is dependent on the drive rating and motor set-up parametersLIMIT[MIN] = 0.0 URRENT_LIMIT for more information. For VM_MOTOR2_CURRENT_LIMIT[MAX] use .007 and Pr 21.010 instead of Pr 05.010.

VM_NEGATIVE	_REF_CLAMP1	Limits applie	ed to the negative frequency clamp (mo	tor 1)					
Units	Hz								
Range of [MIN]	-550.00 to 0.00								
Range of [MAX]	0.00 to 550.00								
	This variable maximum/minimum defines the range of the negative frequency clamp associated with motor map 1 (Minimum Reference Clamp (01.007)). The minimum and maximum are affected by the settings of the Negative Reference Clamp Enable (01.008), Bipolar Reference Enable (01.010) and Maximum Reference Clamp (01.006) as shown in the table below.    Negative   Bipolar   NALIGORING DEF								
Definition	Reference Clamp Reference Enable (01.008) Enable (01.010)		VM_NEGATIVE_REF_ CLAMP1[MIN]	VM_NEGATIVE_REF_ CLAMP1[MAX]					
	0 0		0.00	Pr <b>01.006</b>					
	0	1	0.00	0.00					
	1 X		- VM_POSITIVE_REF_CLAMP[MAX]	0.00					

VM_NEGATIVE	REF_CLAMP2 Limits applied to the negative frequency clamp (motor 2)
Units	Hz
Range of [MIN]	-550.00 to 0.00
Range of [MAX]	0.00 to 550.00
Definition	This variable maximum/minimum defines the range of the negative frequency clamp associated with motor map 2 ( <i>M2 Minimum Reference Clamp</i> (21.002)). It is defined in the same way as VM_NEGATIVE_REF_CLAMP1 except that the <i>M2 Maximum Reference Clamp</i> (21.001) is used instead of <i>Maximum Reference Clamp</i> (01.006).

VM_POWER		Range applied to parameters that either set or display power
Units	kW	
Range of [MIN]	-9999.99 to 0.00	
Range of [MAX]	0.00 to 9999.99	
Definition	with maximum AC output	ing dependent and is chosen to allow for the maximum power that can be output by the drive voltage, at maximum controlled current and unity power factor.  x VM_AC_VOLTAGE[MAX] x VM_DRIVE_CURRENT[MAX] / 1000  _POWER[MAX]

VM_RATED	CURRENT Range applied to rated current parameters
Units	A
Range of [MIN]	0.00
Range of [MAX]	0.00 to 9999.99
Definition	VM_RATED_CURRENT [MAX] = Maximum Rated Current (11.060) and is dependent on the drive rating. VM_RATED_CURRENT [MIN] = 0.00

VM_TORQUE_C	URRENT_UNIPOLAR Unipolar version of VM_TORQUE_CURRENT
Units	%
Range of [MIN]	0.0
Range of [MAX]	0.0 to 1000.0
Definition	VM_TORQUE_CURRENT_UNIPOLAR[MAX] = VM_TORQUE_CURRENT[MAX]  VM_TORQUE_CURRENT_UNIPOLAR[MIN] = 0.0  User Current Maximum Scaling (04.024) defines the variable maximum/minimums VM_USER_CURRENT which is applied to Percentage Load (04.020) and Torque Reference (04.008). This is useful when routing these parameters to an analog output as it allows the full scale output value to be defined by the user. This maximum is subject to a limit of MOTOR1_CURRENT_LIMIT or MOTOR2_CURRENT_LIMIT depending on which motor map is currently active. The maximum value (VM_TORQUE_CURRENT_UNIPOLAR [MAX]) varies between drive sizes with default parameters loaded. For some drive sizes the default value may be reduced below the value given by the parameter range limiting.

VM_USER	_CURRENT	Range applied to torque reference and percentage load parameters with one decimal place
Units	%	
Range of [MIN]	-1000.0 to 0.0	
Range of [MAX]	0.0 to 1000.0	
Definition	VM_USER_CURREI User Current Maximu applied to Percentag an analog output as MOTOR1_CURREN The maximum value	NT[MAX] = User Current Maximum Scaling (04.024)  NT[MIN] = -VM_USER_CURRENT[MAX]  um Scaling (04.024) defines the variable maximum/minimums VM_USER_CURRENT which is the Load (04.020) and Torque Reference (04.008). This is useful when routing these parameters to it allows the full scale output value to be defined by the user. This maximum is subject to a limit of T_LIMIT or MOTOR2_CURRENT_LIMIT depending on which motor map is currently active.  (VM_TORQUE_CURRENT_UNIPOLAR [MAX]) varies between drive sizes with default  For some drive sizes the default value may be reduced below the value given by the parameter

Safety Product Electrica Running the Advanced Optimization NV Media Card Diagnostics **UL** Listina information information installation installation started parameters motor parameters

The brake control functions are provided to allow well co-ordinated operation of an external brake with the drive. While both hardware and software are designed to high standards of quality and robustness, they are not intended for use as safety functions, i.e. where a fault or failure would result in a risk of injury. In any application where the incorrect operation of the brake release mechanism could result in injury, independent protection devices of proven integrity must also be incorporated.

The control terminal relay can be selected as an output to release a brake. If a drive is set up in this manner and a drive replacement takes place, prior to programming the drive on initial power up, the brake may be released.

When drive terminals are programmed to non default settings the result of incorrect or delayed programming must be considered. The use of an NV media card in boot mode can ensure drive parameters are immediately programmed to avoid this situation.

Figure 10-21 Open loop brake function

10.15 Menu 15: Option module set-up
Figure 10-25 Location of option module slot and its corresponding menu number

Option Module Slot 1 - Menu 15

#### 10.15.1 Parameters common to all categories

	Parameter	Range(३)	Default(⇨)			Тур	эе	
15.001	Module ID	0 to 65535		RO	Num	ND	NC	PT
15.002	Software Version	00.00.00 to 99.99.99		RO	Ver	ND	NC	PT
15.003	Hardware Version	0.00 to 99.99		RO	Num	ND	NC	PT
15.004	Serial Number LS	0 to 999999		RO	Num	ND	NC	PT
15.005	Serial Number MS	0 10 999999		RO	Num	ND	NC	PT
15.006	Module Status	-2 to 3		RO	Txt	ND	NC	PT
15.007	Module Reset	Off (0) or On (1)	Off (0)	RW	Bit		NC	

The option module ID indicates the type of module that is installed in the corresponding slot. See the relevant option module user guide for more information regarding the module.

Option module ID	Module	Category
0	No module installed	
209	SI-I/O	Automation (I/O Expansion)
431	SI-EtherCAT	
433	SI-Ethernet	
434	SI-PROFINET V2	Fieldbus
443	SI-PROFIBUS	i leidbus
447	SI-DeviceNet	
448	SI-CANopen

Safety Product Mechanical Running the Optimization NV Media Card Diagnostics **UL** Listina motor information information installation installation started parameters parameters

#### 11 **Diagnostics**

The keypad display on the drive gives various information about the status of the drive. The keypad display provides information on the following categories:

- Trip indications
- Alarm indications
- Status indications

Users must not attempt to repair a drive if it is faulty, nor carry out fault diagnosis other than through the use of the diagnostic features described in this chapter. If a drive is faulty, it must be returned to an authorized WARNING Control Techniques distributor for repair.

#### 11.1 Status modes (Keypad and LED status)

Figure 11-1 Keypad status modes

- Drive OK status
- 2 Trip status
- Alarm status

#### 11.2 Trip indications

The output of the drive is disabled under any trip condition so that the drive stops controlling the motor. If the motor is running when the trip occurs it will coast to a stop.

During a trip condition, the display indicates that a trip has occurred and the keypad will display the trip string. Some trips have a sub-trip number to provide additional information about the trip. If a trip has a sub-trip number, the sub-trip number is flashed alternately with the trip string.

Trips are listed alphabetically in Table 11-2 based on the trip indication shown on the drive display. Alternatively, the drive status can be read in Pr 10.001 'Drive OK' using communication protocols. The most recent trip can be read in Pr 10.020 providing a trip number. It must be noted that the hardware trips (HF01 to HF23) do not have trip numbers. The trip number must be checked in Table 11-2 to identify the specific trip.

#### Example

- 1. Trip code 2 is read from Pr 10.020 via serial communications.
- 2. Checking Table 11-3 shows Trip 2 is an Over Volts trip.

- Look up OV in Table 11-2.
- Perform checks detailed under Diagnosis.

#### 11.3 Identifying a trip / trip source

Some trips only contain a trip string whereas some other trips have a trip string along with a sub-trip number which provides the user with additional information about the trip.

A trip can be generated from a control system or from a power system. The sub-trip number associated with the trips listed in Table 11-1 is in the form xxyzz and used to identify the source of the trip.

Table 11-1 Trips associated with xxyzz sub-trip number

OV	PH.Lo
PSU	OI.Sn
Oht.I	tH.Fb
Oht.P	P.dAt
Oh.dc	

The digits xx are 00 for a trip generated by the control system. For a drive, if the trip is related to the power system then xx will have a value of 01, when displayed the leading zeros are suppressed.

For a control system trip (xx is zero), the y digit where relevant is defined for each trip. If not relevant, the y digit will have a value of zero.

The zz digits give the reason for the trip and are defined in each trip description.

Figure 11-2 Key to sub-trip number

# 11.4 Trips, Sub-trip numbers

#### Table 11-2 Trip indications

Trip	Diagnosis
C.Acc	NV Media Card Write fail
185	The C.Acc trip indicates that the drive was unable to access the NV Media Card. If the trip occurs during the data transfer the card then the file being written may be corrupted. If the trip occurs when the data being transferred to the drive then the data transfer may be incomplete. If a parameter file is transferred to the drive and this trip occurs during the transfer, the parameters are not saved to non-volatile memory, and so the original parameters can be restored by powering the drive down and up again.
	Recommended actions:  Check NV Media Card is installed / located correctly Replace the NV Media Card
C.by	NV Media Card cannot be accessed as it is being accessed by an option module
178	The <i>C.by</i> trip indicates that an attempt has been made to access a file on NV Media Card, but the NV Media Card is alread being accessed by an option module. No data is transferred.
	Recommended actions:
	Wait for the option module to finish accessing the NV Media Card and re-attempt the required function
C.cPr	NV Media Card file/data is different to the one in the drive
	A compare has been carried out between a file on the NV Media Card and the drive, a <i>C.cPr</i> trip is initiated if the parameters on the NV Media Card are different to the drive.
188	Recommended actions:
	<ul> <li>Set Pr mm.000 to 0 and reset the trip</li> <li>Check to ensure the correct data block on the NV Media Card has been used for the compare</li> </ul>
C.d.E	NV Media Card data location already contains data
	The C.d.E trip indicates that an attempt has been made to store data on a NV Media Card in a data block which already contains data.
179	Recommended actions:
	Erase the data in data location
	Write data to an alternative data location
C.dAt	NV Media Card data not found
	The C.dAt trip indicates that an attempt has been made to access a non-existent file on the NV Media Card.
183	No data is transferred.
100	Recommended actions:
	Ensure data file number is correct
C.Err	NV Media Card data structure error
	The <i>C.Err</i> trip indicates that an attempt has been made to access the NV Media Card but an error has been detected in the data structure on the card. Resetting the trip will cause the drive to erase and create the correct folder structure. On an Scard, whilst this trip is present, missing directories will be created and if the header file is missing it will be created. The cause of the trip can be identified by the sub-trip.
	Sub-trip Reason
	1 The required folder and file structure is not present
182	2 The 000.DAT file is corrupted
	Two or more files in the <mcdf\> folder have the same file identification number</mcdf\>
	Recommended actions:
	<ul> <li>Erase all the data block and re-attempt the process</li> <li>Ensure the card is located correctly</li> </ul>
	Replace the NV Media Card
C.FuL	NV Media Card full
	The C.FuL trip indicates that an attempt has been made to create a data block on a NV Media Card, but there is not enough space left on the card. No data is transferred.
184	Recommended actions:
	Delete a data block or the entire NV Media Card to create space
	Use a different NV Media Card

		8			ardware has									
31		9	The chec	ksum on t	he non-parai	meter area o	f the EEPRO	M has failed						
		The drive holds two banks of user save parameters and two banks of power down save parameters in non-volatile memory. If the last bank of either set of parameters that was saved is corrupted a <i>U.S</i> or <i>Pd.S</i> trip is produced. If one of these trips occurs the parameters values that were last saved successfully are used. It can take some time to save parameters wher requested by the user and if the power is removed from the drive during this process it is possible to corrupt the data in the non-volatile memory. If both banks of user save parameters or both banks of power down save parameters are corrupted or one of the other conditions given in the table above occurs <i>EEF</i> .xxx trip is produced. If this trip occurs it is not possible to use the data tha has been saved previously, and so the drive will be loaded with default parameters. The trip can only be reset if <i>Paramete mm.000</i> (mm.000) is set to 10, 11, 1233 or 1244 or if <i>Load Defaults</i> (11.043) is set to a non-zero value.  Recommended actions:  • Default the drive and perform a reset												
		<ul> <li>If the trip</li> </ul>	persists - r	eturn drive	e to supplier

Check brake resistor wiring

Product Safety Mechanica Running the Optimization NV Media Card Diagnostics **UL** Listina information information installation installation started parameters motor parameters Trip Diagnosis OI.Sn Snubber over-current detected This trip indicates that an over-current condition has been detected in the rectifier snubbing circuit, The exact cause of the trip can be identified by the sub-trip number. Source хx ΖZ Description у Power 01 1 ΛN Rectifier snubber over-current trip detected. system 92 Recommended actions: Ensure the internal EMC filter is installed Ensure the motor cable length does not exceed the maximum for selected switching frequency Check for supply voltage imbalance Check for supply disturbance such as notching from a DC drive Check the motor and motor cable insulation with an insulation tester. Install a output line reactor or sinusoidal filter OI.SC Output phase short-circuit Over-current detected on drive output when enabled. Possible motor earth fault. Recommended actions: 228 Check for short circuit on the output cabling Check integrity of the motor insulation using an insulation tester Is the motor cable length within limits for the frame size? Out.P Output phase loss detected The Out.P trip indicates that phase loss has been detected at the drive output. Sub-trip Reason U phase detected as disconnected when drive enabled to run. 2 V phase detected as disconnected when drive enabled to run. 3 W phase detected as disconnected when drive enabled to run. The drive output frequency is above 4 Hz and a phase is disconnected for the time 4 specified by Output Phase Loss Detection Time (06.058). 98 If Pr 05.042 = 1, the physical output phases are reversed, and so sub-trip 3 refers to physical output phase V and sub-trip 2 refers to physical output phase W. Recommended actions: Check motor and drive connections

To disable the trip set Output Phase Loss Detection Enable (06.059) = 0

Safety Product information installation installation Belectrical installation installation below the following started information in the parameters parameters in the parameters parameter

# Trip Diagnosis OV DC bus voltage has exceeded the peak level or maximum continuous level for 15 seconds

The OV trip indicates that the DC bus voltage has exceeded the VM\_DC\_VOLTAGE[MAX] or

VM\_DC\_VOLTAGE\_SET[MAX] for 15 s. The trip threshold varies depending on voltage rating of the drive as shown below.

Voltage rating	VM_DC_VOLTAGE[MAX] Frame 1 to 4	VM_DC_VOLTAGE[MAX] Frame 5 to 9	VM_DC_VOLTAGE_SET[MAX]
100	510	415	400
200	510	415	400
400	870	830	800
575	N/A	990	955
690	N/A	1190	1150

Source	xx	У	zz
Control system	00	0	01: Instantaneous trip when the DC bus voltage exceeds VM_DC_VOLTAGE[MAX].
Control system	00	0	02: Time delayed trip indicating that the DC bus voltage is above VM_DC_VOLTAGE_SET[MAX].
Power system	01	0	00: Instantaneous trip when the DC bus voltage exceeds VM_DC_VOLTAGE[MAX].

#### Recommended actions:

- Increase deceleration ramp (Pr 00.004)
- · Decrease the braking resistor value (staying above the minimum value)
- · Check nominal AC supply level
- · Check for supply disturbances which could cause the DC bus to rise
- Check motor insulation using an insulation tester

### P.dAt Power system configuration data error

The *P.dAt* trip indicates that there is an error in the configuration data stored in the power system. This trip can be generated from either the drive control system or from the power system. The trip is related to the table uploaded from the power system at power-up.

Source	xx	У	ZZ	Description
Control system	00	0	01	No data was obtained from the power board.
Control system	00	0	02	There is no data table.
Control system	00	0	03	The power system data table is bigger than the space available in the control pod to store it.
Control system	00	0	04	The size of the table given in the table is incorrect.
Control system	00	0	05	Table CRC error.
Control system	00	0	06	The version number of the generator software that produced the table is too low.
Control system	0	0	07	The power data table failed to be stored in the power board.
Power system	01	0	00	The power data table used internally by the power module has an error.
Power system	01	0	01	The power data table that is uploaded to the control system on power up has an error.
Power system	01	0	02	The power data table used internally by the power module does not match the hardware identification of the power module.

The PH.Lo trip works by monitoring the ripple voltage on the DC bus of the drive, if the DC bus ripple exceeds the threshold, the drive will trip on PH.Lo. Potential causes of the DC bus ripple are input phase loss, Large supply impedance and severe output current instability.  Source	23	5												
The Pd.S trip indicates that an error has been detected in the power down save parameters saved in non-volatile memory.  Recommended actions:  Perform a 1001 save in Pr mm.000 to ensure that the trip doesn't occur the next time the drive is powered up.  Supply phase loss  The PH.Lo trip indicates that the drive has detected an input phase loss or large supply imbalance. The drive will attempt to stop the motor before this trip is initiated, If the motor cannot be stopped in 10 seconds the trip occurs immediately. The PH.Lo trip works by monitoring the ripple voltage on the DC bus of the drive, if the DC bus ripple exceeds the threshold, the drive will trip on PH.Lo. Potential causes of the DC bus ripple are input phase loss, Large supply impedance and severe output current instability.  Source xx y y zz  Control Source xx y y 00: Phase loss detected based on control system feedback. The drive attempts to stop the drive before tripping unless bit 2 of Action On Trip Detection (10.037) is set to one.  Power 01 0 00: Phase loss has been detected by the rectifier module.  Input phase loss detection can be disabled when the drive is required to operate from the DC supply or from a single phase supply in Input Phase Loss Detection Mode (06.047). ### RAM allocation error

The *r.All* trip indicates that an option module derivative image has requested more parameter RAM than is allowed. The RAM allocation is checked in order of resulting sub-trip numbers, and so the failure with the highest sub-trip number is given. The sub-trip is calculated as (parameter size) + (parameter type) + sub-array number.

Parameter size	Value
1 bit	1
8 bit	2
16 bit	3
32 bit	4
64 bit	5

Parameter type	Value
Volatile	0
User save	1
Power-down save	2

#### Table 11-4 Trip categories

Priority	Category	Trips	Comments
1	Internal faults	HFxx	These indicate internal problems and cannot be reset. All drive features are inactive after any of these trips occur.
1	Stored HF trip	{St.HF}	This trip cannot be cleared unless 1299 is entered into <i>Parameter</i> (mm.000) and a reset is initiated.
2	Non-resettable trips	Trip numbers 218 to 247, {SL.HF}	These trips cannot be reset.
3	Volatile memory failure	{EEF}	This can only be reset if Parameter <b>mm.000</b> is set to 1233 or 1244, or if Load Defaults (11.043) is set to a non-zero value.
4	NV Media Card trips	Trip numbers 174, 175 and 177 to 188	These trips are priority 5 during power-up.
4	Internal 24V	{PSU}	Rectifier 24 V
5	Trips with extended reset times	{OI.AC}, {OI.br}, and FAn.F	These trips cannot be reset until 10 s after the trip was initiated.
5	Phase loss and d.c. link power circuit protection	{PH.Lo} and {Oh.dc}	The drive will attempt to stop the motor before tripping if a {PH.Lo} trip occurs unless this feature has been disabled (see <i>Action On Trip Detection</i> (10.037). The drive will always attempt to stop the motor before tripping if an {Oh.dc} occurs.
5	Standard trips	All other trips	

## 11.5 Internal / Hardware trips

Trips {HF01} to {HF23} are internal faults that do not have trip numbers except HF08, HF11, HF12 and HF18. If one of these trips occurs, the main drive processor has detected an irrecoverable error. All drive functions are stopped and the trip message will be displayed on the drive keypad. If a non permanent trip occurs this may be reset by power cycling the drive. On power up after it has been power cycled the drive will trip on St.HF (the sub-trip number indicates the HF fault code). Enter 1299 in **mm.000** to clear the Stored HF trip.

#### 11.6 Alarm indications

In any mode, an alarm is an indication given on the display by alternating the alarm string with the drive status string display. If an action is not taken to eliminate any alarm except "tuning", "LS" or "24.LoSt" the drive may eventually trip. Alarms are not displayed when a parameter is being edited.

Table 11-5 Alarm indications

Alarm string	Description
br.res	Brake resistor overload. <i>Braking Resistor Thermal Accumulator</i> (10.039) in the drive has reached 75.0 % of the value at which the drive will trip.
OV.Ld	Motor Protection Accumulator (04.019) in the drive has reached 75.0 % of the value at which the drive will trip and the load on the drive is >100 %.
d.OV.Ld	Drive over temperature. Percentage Of Drive Thermal Trip Level (07.036) in the drive is greater than 90 %.
tuning	The autotune procedure has been initialized and an autotune in progress.
LS	Limit switch active. Indicates that a limit switch is active and that is causing the motor to be stopped.
Opt.Al	Option slot alarm.
Lo.AC	Low voltage mode. See Low AC Alarm (10.107).
I.AC.Lt	Current limit active. See Current Limit Active (10.009).
24.LoSt	24V backup not present. See 24V Alarm Loss Enable (11.098)

#### 11.7 Status indications

#### Table 11-6 Status indications

String	Description	Drive output stage
inh	The drive is inhibited and cannot be run. Either the drive enable signal is not applied to the drive enable terminals or Pr <b>06.015</b> is set to 0.	Disabled
rdy	The drive is ready to run. The drive enable is active, but the drive inverter is not active because the final drive run is not active.	Disabled
StoP	The drive is stopped / holding zero speed.	Enabled
S.Loss	Supply loss condition has been detected.	Enabled
dc.inJ	The drive is applying dc injection braking.	Enabled
Er	The drive has tripped and no longer controlling the motor. The trip code appears in the display.	Disabled
UV	The drive is in the under voltage state either in low voltage or high voltage mode.	Disabled
HEAt	The motor pre-heat function is active	Enabled

Table 11-7 Option module and NV Media Card and other status indications at power-up

String	Status
	Waiting for power stage
The drive is waiting for the	ne processor in the power stage to respond after power-up.
LOAD OPtion	Waiting for an option module
	ne Option Module to respond after power-up.
	Loading parameter database
At power-up it may be ne	cessary to update the parameter database held in the drive because an option module has changed. This may involve data
transfer between the driv	re and option module. During this period 'UPLOAD' is displayed.
LOAD.I	Bootloading drive firmware
The drive is waiting for the	ne bootloader file to be transferred to the processor.

## 11.8 Displaying the trip history

The drive retains a log of the last ten trips that have occurred. *Trip 0* (10.020) to *Trip 9* (10.029) store the most recent 10 trips that have occurred where *Trip 0* (10.020) is the most recent and *Trip 9* (10.029) is the oldest. When a new trip occurs it is written to *Trip 0* (10.020) and all the other trips move down the log, with oldest being lost. The date and time when each trip occurs are also stored in the date and time log, i.e. *Trip 0 Date* (10.041) to *Trip 9 Time* (10.060). The date and time are taken from *Date* (06.016) and *Time* (06.017). Some trips have sub-trip numbers which give more detail about the reason for the trip. If a trip has a sub-trip number its value is stored in the sub-trip log, i.e. *Trip 0 Sub-trip Number* (10.070) to *Trip 9 Sub-trip Number* (10.079). If the trip does not have a sub-trip number then zero is stored in the sub-trip log.

If any parameter between Pr 10.020 and Pr 10.029 inclusive is read by serial communication, then the trip number in Table 11-2 is the value transmitted.

#### NOTE

The trip logs can be reset by writing a value of 255 in Pr 10.038 (via serial communications only).

Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	NV Media Card	Advanced parameters	Diagnostics	UL Listing
--------------------	---------------------	-------------------------	-------------------------	--------------------	------------------	-------------------	--------------	---------------	---------------------	-------------	------------

# 11.9 Behaviour of the drive when tripped

If the drive trips, the output of the drive is disabled so the load coasts to a stop. If any trip occurs, the following read only parameters are frozen until the trip is cleared. This is to help diagnose the cause of the trip.

Parameter	Description
01.001	Frequency reference
01.002	Pre-skip filter reference
01.003	Pre-ramp reference
01.069	Reference in rpm
01.070	Clamped reference
02.001	Post-ramp reference
03.001	Final demand ref
03.002	Estimated frequency
03.003	Frequency error
03.004	Frequency controller output
03.045	Frequency reference
04.001	Current magnitude
04.002	Active current
04.017	Reactive current
05.001	Output frequency
05.002	Output voltage
05.003	Power
05.005	DC bus voltage
07.001	Analog input 1
07.002	Analog input 2

If the parameters are not required to be frozen then this can be disabled by setting bit 4 of Pr 10.037.

# 12 UL Listing

### 12.1 UL file reference

All products covered by this Guide are UL Listed to both Canadian and US requirements. The UL file reference is: NMMS/7.E171230.

## 12.2 Option modules, kits and accessories

All Option Modules, Control Pods and Installation Kits supplied by Emerson Industrial Automation for use with these drives are UL Listed.

### 12.3 Enclosure ratings

Drives are UL Open Type as supplied.

Drives fitted with a conduit box are UL Type 1.

Drives that are capable of through-hole mounting are UL Type 12 when installed with the high-IP insert (where provided), and the Type 12 sealing kit to prevent ingress of dust and water.

Remote Keypads are UL Type 12.

### 12.4 Mounting

Drives can be mounted directly onto a vertical surface. This is known as 'surface' or 'standard' mounting. Refer to relevant Power Installation Guide for further information.

Drives can be installed side by side with recommended spacing between them. This is known as 'bookcase' mounting. Refer to relevant Power Installation Guide for further information.

Some drives can be mounted on their side. This is known as 'tile' mounting. Suitable tile mounting kits are available from Emerson Industrial Automation. Refer to relevant Power Installation Guide for further information.

Drives fitted with a conduit box can be mounted directly onto a wall or other vertical surface without additional protection. Suitable conduit boxes are available from Emerson Industrial Automation.

Some drives may be through-hole mounted. Mounting brackets and sealing kits are available from Emerson Industrial Automation. Refer to relevant Power Installation Guide for further information.

Remote Keypads can be mounted on the outside of a UL Type 12 enclosure. A sealing and mounting kit is provided with the keypad.

#### 12.5 Environment

Drives must be installed in a Pollution Degree 2 environment or better (dry, non-conductive pollution only).

All drives are capable of delivering full rated output current at surrounding air temperatures up to 40  $^{\circ}\text{C}.$ 

Drives may be operated in surrounding air temperatures up to 50  $^{\circ}$ C or 55  $^{\circ}$ C at de-rated current, depending on the model number. Refer to relevant Power Installation Guide for further information.

#### 12.6 Electrical Installation

**TERMINAL TORQUE** 

Terminals must be tightened to the rated torque as specified in the Installation Instructions. Refer to relevant Power Installation Guide for further information.

WIRING TERMINALS

Drives must be installed using cables rated for 75  $^{\circ}\text{C}$  operation, copper wire only.

UL Listed closed-loop connectors sized according to the field wiring shall be used for all field wiring connections. Refer to relevant Power Installation Guide for further information.

**BRANCH CIRCUIT PROTECTION** 

The fuses and circuit breakers required for branch circuit protection are contained in the Installation Instructions. Refer to relevant Power Installation Guide for further information.

#### OPENING OF BRANCH CIRCUIT

Opening of the branch-circuit protective device may be an indication that a fault has been interrupted. To reduce the risk of fire or electric shock, the equipment should be examined and replaced if damaged. If burnout of the current element of an overload relay occurs, the complete overload relay must be replaced.

Integral solid state short circuit protection does not provide branch circuit protection. Branch circuit protection must be provided in accordance with the National Electrical Code and any additional local "codes".

DYNAMIC BRAKING

Drives with model numbers beginning M100, M101, M200, M201, M300 or M400 have been evaluated for dynamic braking applications.

# 12.7 Motor overload protection and thermal memory retention

All drives incorporate internal overload protection for the motor load that does not require the use of an external or remote overload protection device.

The protection level is adjustable and the method of adjustment is provided in section 8.4 *Motor thermal protection* on page 58. Maximum current overload is dependent on the values entered into the current limit parameters (motoring current limit, regenerative current limit and symmetrical current limit entered as percentage) and the motor rated current parameter (entered in amperes).

The duration of the overload is dependent on motor thermal time constant. The time constant is programmable. The default overload protection is typically set to 150 % of the motor rated current for 120 seconds.

The drives are provided with user terminals that can be connected to a motor thermistor to protect the motor from high temperature, in the event of a motor cooling fan failure.

The method of adjustment of the overload protection is provided in the Installation Instructions shipped with the product.

All models are provided with thermal memory retention.

## 12.8 Electrical supply

The drives are suitable for use on a circuit capable of delivering not more than 100,000 RMS Symmetrical Amperes, at rated voltage when protected by fuses as specified in the Installation Instructions.

Some smaller drives are suitable for use on a circuit capable of delivering not more than 10,000 RMS Symmetrical Amperes, at rated voltage when protected by circuit breakers as specified in the Installation Instructions.

### 12.9 External Class 2 supply

The external power supply used to power the 24 V control circuit shall be marked: "UL Class 2". The power supply voltage shall not exceed 24 Vdc.

# 12.10 Requirement for Transient Surge Suppression

This requirement applies to drives with rated input voltage = 575 V, Frame Size 7 only.

TRANSIENT SURGE SUPPRESSION SHALL BE INSTALLED ON THE LINE SIDE OF THIS EQUIPMENT AND SHALL BE RATED 575 Vac (PHASE TO GROUND), 575 Vac (PHASE TO PHASE), SUITABLE FOR OVERVOLTAGE CATEGORY III, AND SHALL PROVIDE PROTECTION FOR A RATED IMPULSE VOLTAGE TO WITHSTAND VOLTAGE PEAK OF 6 kV AND A CLAMPING VOLTAGE OF MAXIMUM 2400 V.

**150** 

Safety Product Mechanical Electrica Basic Running the Advanced Optimization NV Media Card Diagnostics **UL** Listina information information installation parameters installation started motor parameters

# 12.11 Group Installation and Modular Drive Systems

Drives with DC+ and DC- supply connections, with 230 V or 480 V supply voltage rating, are UL approved for use in modular drive systems as inverters when supplied by the converter sections: Mentor MP25A, 45A, 75A, 105A, 155A or 210A range manufactured by Emerson Industrial Automation.

Alternatively, the inverters may be supplied by converters from the Unidrive-M range manufactured by Emerson Industrial Automation.

In these applications the inverters are required to be additionally protected by supplemental fuses.

Drives have not been evaluated for other Group Installation applications, for example where a single inverter is wired directly to two or more motors. In these applications, additional thermal overload protection is needed. Contact Emerson Industrial Automation for further details.
